ABSTRACT

ABUEVA, ALDRIX T., AGUANTA, STEPHANIE ROSE C., AGUANZA, MARIANNE B., BACSA, BEA ANGELA M., GUADALQUIVER, ART XENOS D., LIMBADAN RASBY JOHN C., SUMAYA, JELIAN NICHOLE P., Academic – Science, Technology, Engineering and Mathematics, Senior High School, Tibanban National High School, Tibanban, Governor Generoso, Davao Oriental, Philippines, April 2024, **DIGITAL LITERACY AND STUDENT-FACULTY INTERACTION: A QUANTITATIVE STUDY AMONG SENIOR HIGH SCHOOL STUDENTS**

This quantitative descriptive-correlational study aimed to determine the relationship between digital literacy and student-faculty interaction among senior high school students at Tibanban National High School, Governor Generoso, Davao Oriental. Using stratified sampling, data were gathered from 166 students through a validated Likert scale questionnaire assessing digital literacy in terms of operational, thinking, collaboration, and awareness skills, alongside student-faculty interaction in terms of trust, communication, level of engagement, and collaborative outcomes.

Findings revealed that while students exhibited high operational, thinking and awareness skills, their collaboration skills required improvement. The study found a significant positive correlation between student-faculty interaction especially in the areas of collaborative outcomes, while trust, communication and level of engagement were moderate.

The study recommends integrating digital literacy programs into the curriculum to enhance student-faculty engagement. Faculty should utilize digital tools to foster interactive learning, while schools and policymakers should improve digital literacy training to support student development in digital learning environments.

APPROVAL SHEET

In fulfillment of the requirements for the subject Inquiries, Investigation, and Immersion, this research entitled **DIGITAL LITERACY AND STUDENT-FACULTY INTERACTION: A QUANTITATIVE STUDY AMONG SENIOR HIGH SCHOOL STUDENTS**, has been examined and is hereby recommended for approval and acceptance.

Approved by the Research Advisory committee:

JOVITO B. CRODUA JR.
Chairperson

Accepted in fulfillment of the requirements for the subject, Inquiries, Investigation, and Immersion.

GREG C. CAJEGAS
Principal III

ACKNOWLEDGMENT

The researcher extends their heartfelt gratitude to the following individuals who have greatly contributed to the completion of this research:

Teacher Jovito B. Crodua Jr., our research teacher and esteemed panel member, whose valuable recommendations significantly influenced the development of this study.

To our **Validators**, whose contributions have greatly enhanced the credibility and quality of our research.

To our **Grammarians**, whose careful review and guidance have helped ensure the clarity and accuracy of our research.

To our **beloved parents**, whose unwavering support, encouragement, and understanding have been indispensable throughout this research journey.

And lastly to our **Almighty God**, the ultimate source of wisdom, strength, good health, knowledge, and guidance. Without His divine guidance and mercy, this study would not have been possible.

To all who have been part of this journey towards success, the researcher extends their sincere thanks for their unwavering support and invaluable contributions.

DEDICATION

*To our Almighty God,
the main source of wisdom and guidance,
to my beloved parents, brothers, sister, and nieces,
for the unconditional love and support.*

Chapter I

INTRODUCTION

Background of the Study

Digital literacy encompassed a range of skills that enabled individuals to effectively navigate, evaluate, and create information using digital technologies. It was increasingly recognized as a foundational competency for students, particularly in the context of Education 4.0, which emphasized the integration of technology in learning processes (Laudato & Punzalan, 2021). Students who possessed strong digital literacy skills were better equipped to engage with educational content, collaborate with peers, and communicate with instructors, thereby enhancing their overall learning experience and academic success (Gutiérrez et al., 2022).

The widespread use of digital tools globally had become essential to daily life, especially in gathering information, communication, and entertainment. In educational contexts, the integration of digital tools had significantly enhanced learning and teaching activities (Durriyah & Zuhdi, 2018). However, in Indonesia, most students still lacked literacy skills, as proven by their low ability to read and write (Nuroh & Liansari, 2018), leading to low digital literacy in the learning process (Pagani et al., 2016). Digital literacy is a global issue that required localized solutions to fit the specific demands and circumstances of many nations and regions.

Moreover, the Philippines faced several significant challenges in digital literacy, including limited access to digital devices, inadequate skills in using these tools, and the prevalence of fake news. In a news article published in Rappler by Billones on March 23, 2024, the Philippines was identified as the leading country with the highest level of digital illiteracy concerning ICT literacy skills. This digital illiteracy rapidly contributed to the growing disinformation environment, as individuals were incapable of checking the reliability of information, leading to the spread of fake news. Thus, misinformation and digital illiteracy created a threat to the safety, trust, and perception of the population.

The local challenges in ICT integration includes insufficient budget allocation and inadequate ICT infrastructure (Brasileno & Bidad, 2021). In teaching and learning, issues involved teachers' moderate confidence in technology operations, learners' slight confidence in key skills, and the need for more training in device operations and concepts (Arnado & Aviles, 2023).

Despite increasing demands for digital technologies in classrooms, there was still a considerable gap in research on how digital literacy influenced the nature of student-faculty interactions at the Senior High School (SHS) level. Therefore, this study aimed to fill this gap by quantitatively analyzing the relationship between digital literacy and the effectiveness of student-faculty interactions among senior high school students, thereby offering insights that could be used to shape future secondary education practices and policies.

Statement of the Problem

This study aimed to determine the relationship between digital literacy and student-faculty interaction.

It specifically sought to answer the following questions:

1. What is the extent of digital literacy among senior high school students in terms of:
 - 1.1 operational skills;
 - 1.2 thinking skills;
 - 1.3 collaboration skills; and
 - 1.4 awareness skills?
2. What is the level of student-faculty interaction in terms of:
 - 2.1 trust;
 - 2.2 communication;
 - 2.3 level of engagement; and
 - 2.4 collaborative outcomes?
3. Is there a significant relationship between digital literacy and student-faculty interaction among senior high school students?

Objective of the Study

Generally, this study was proposed to determine the relationship between digital literacy and student-faculty interaction.

It specifically sought to:

1. Determine the extent of digital literacy in terms of:
 - 1.1 operational skills;
 - 1.2 thinking skills;
 - 1.3 collaboration skills; and
 - 1.4 awareness skills.
2. Determine the level of student-faculty interaction in terms of:
 - 2.1 trust;
 - 2.2 communication;
 - 2.3 level of engagement; and
 - 2.4 collaborative outcomes.
3. Determine the significant relationship between digital literacy and student-faculty interaction.

Hypothesis

H₀: There is no significant relationship between digital literacy and student-faculty interaction.

Significance of the Study

This study focused on the relationship between digital literacy and student-faculty interaction among senior high school students. This study will be significant for faculty members, educational institutions, policymakers, curriculum developers, future employers, and future researchers.

Faculty Members. The findings may be an interest to teachers and students. By highlighting the importance of digital literacy to facilitate efficient

communication and interaction with students, this research may inform teaching practice. In order to develop strategies for enhancing the engagement of faculty with students and improving their overall educational experience, they may be able to draw on lessons learnt in this study.

Educational Institutions. Significant beneficiaries are schools and educational institutions since they can apply the findings of this study for curriculum development and faculty training programs. Institutions could develop policies and practices to encourage the development of digital skills throughout the curriculum and prepare students for professional challenges in both academic and practical fields by recognizing the role played by digital literacy in student faculty interactions.

Policymakers. The findings of this study could be used by policy makers in education to advocate for the inclusion of digital literacy as part of curriculum and frameworks. The research highlights the need to promote policies supporting initiatives on digital literacy and ensure that all students have access to essential resources and training in order for them thrive in a rapidly changing world of technology.

Curriculum Developers. This study may be used as a reference in developing the curriculum in students' education, especially in digital literacy. They can include activities designed for enhancing digital literacy in the modules. These activities could integrate technology to improve students' digital skills, such as creating digital projects like PowerPoint and Google Slides to organize

and present information digitally, online research projects, and online discussions to deepen understanding and engagement in digital concepts.

Future Researchers. This will offer a valuable insight to future researchers in the impact of digital literacy skills on communication and engagement in academic settings. The findings can help identify gaps in digital competencies and suggest strategies to enhance effective interactions between students and faculty. Additionally, this research can serve as a basis for future studies exploring policy improvements and digital literacy programs in educational institutions.

Scope and Delimitation of the Study

This study focused on the relationship between digital literacy and student-faculty interaction. Digital literacy included operation, thinking, collaboration, and awareness skills. Consequently, student-faculty interaction encompassed trust, communication, level of engagement, and collaborative outcomes.

The study's respondents consisted of senior high school students from all academic strands at one of Governor Generoso's secondary schools, particularly in the North District. Students in grades 7 to 10 were not included in the research population due to a potential lack of capacity or capability to responsibly use digital technologies

Moreover, the study was conducted at Tibanban National High School, located in Tibanban, Governor Generoso, Davao Oriental, a secondary school in

Governor Generoso North District.

Finally, this study took place during the academic year 2024–2025, with a primary focus on exploring students' digital literacy and student-faculty interaction. Any changes in students' digital literacy and their pedagogical relationship beyond this timeframe were not considered.

Definition of Terms

To enhance the readers' comprehension of the study, the following terms were defined both conceptually and operationally:

Awareness skill refers to the students' abilities to understand the consequences of technology use and the right adoption of technology. This comprises the following social factors: privacy concerns and the effects of their conduct in the virtual space on self and academic performance (Hobbs, 2017). As used in this study, awareness skills in digital literacy refer to the student's ability to recognize and critically evaluate digital information and tools. This includes understanding online safety, discerning credible sources from misinformation, and engaging responsibly in digital spaces.

Collaboration skill is defined as the ability of the students to use digital tools while being in harmony as they pursue other educational goals. Communicative and project management tools need to be implemented to foster teamwork and improve conflict-solving skills (Voogt & Roblin, 2012). In the context of this study, collaboration skills in digital literacy refer to the ability of students to effectively work with others using digital tools and platforms. This

includes participating in digital teams, utilizing shared productivity tools, and communicating across cultural and linguistic boundaries.

Collaborative outcomes are result from the interactions that involve the use of the devices by the students and include better problem-solving and increased creativity. Such outcomes arise in settings that enable cooperative learning and the exchange of information through computer-mediated contexts (Dede, 2010). In the context of this research, collaborative outcomes in digital literacy refer to the benefits that senior high school students of Tibanban National High School gain when they engage in collaborative learning activities using digital tools and technologies.

Communication refers to the mastery of the transmission of digital information, knowledge, and data and the sharing of this information through available digital platforms. The purpose is to connect with peers and instructors through email, social media, and other collaborative tools (Greenhow & Lewin, 2016). As used in this study, communication in digital literacy refers to the ability of students to effectively use digital tools and platforms to share and exchange information. This encompasses both technical skills, such as navigating social media and email, and social skills, including understanding etiquette for the internet and respectful online interactions.

Digital literacy refers to a person's capability to find, organize, analyze, and generate information using digital media. It includes problem-solving and technology literacy competencies (Rheingold, 2012). In the context of this study,

digital literacy refers to the student's ability to effectively find, evaluate, create, and communicate information using digital platforms.

Level of engagement is defined as to what extent students engage in their learning processes with the help of ICT tools. A clear measure used is the level of participation in online activities, which is defined by frequent interaction with the content (Kuh, 2009). As employed in the study, the level of engagement in digital literacy among students refers to the extent to which they actively participate in learning activities that utilize digital technologies.

Operation skill is referred to as the concepts that entail the students' effectiveness in using devices and software. These include running simple operations such as using a computer, browsing education-related websites, and using a learning management system (Wei, 2012). As employed in the study, operational skills refer to the abilities and methods that effectively help the senior high students of Tibanban National High School take in, understand, process, and remember knowledge in a classroom setting.

Thinking skill is defined as cognitive processes of technology which includes the comprehension that a person masters in analyzing, assessing, or even generating content that is technology related. These skills help as important facilities to perform critical thinking and solving tasks in the digital environment (Williamson & Piattoeva, 2019). Within the framework of this study, thinking skills in digital literacy refer to the students' ability to critically analyze, synthesize, and evaluate digital content.

Trust is defined as the ability to which students have confidence in digital technologies and information sources as credible and safe in relation to their use. This form of trust is relevant when it comes to the use of technology to interact and in this case retrieve information from the internet and social platforms (Miller, 2013). In the context of this study, trust refers to the confidence students have in the ability of people, technology, and processes to create a secure digital world.

Student-faculty in digital literacy refers to the processes taken on the digital platforms that is used to communicate and work with students and teacher in active participation of student-faculty cooperation. Efficiently establishing communication opens avenues for help and feedback, hence enhancing academic achievements (Garrison et al., 2001). In this research, student-faculty interaction in digital literacy refers to how students engage with faculty through digital platforms to enhance learning and communication.

Chapter II

REVIEW OF RELATED LITERATURE AND FRAMEWORK

Digital Literacy

Yesilyurt & Vezne (2023) established that individuals with higher levels of digital, technological, and internet literacy were more likely to perceive computer-supported education as beneficial. Their findings indicated that digital literacy was a crucial factor influencing positive attitude towards educational technologies, suggesting that enhancing these skills was essential for effective technology integration in education.

In addition, Naz and colleagues (2022) conducted a study involving university students in Lahore, Pakistan, which demonstrated that students proficient in digital literacy achieved better academic results. Notably, female students outperformed their male peers in this regard. The authors advocated for the inclusion of digital literacy training in university curricula to bolster academic success. Further supporting this notion, a meta-analysis by Guttiérrez and colleagues (2022) highlighted the growing importance of digital literacy among college students, emphasizing its role in enhancing educational outcomes and adapting curricula to include these competencies.

Research by Murtadho and colleagues (2023) indicated that digital literacy encompassed more than just technical skills; it included understanding the implications of technology on learning and future readiness. Moreover, their qualitative study underscored the need for comprehensive digital literacy

frameworks that addressed various competencies, including ethical considerations and critical thinking.

Despite recognizing the importance of digital literacy, several studies pointed out existing gaps in education regarding its coverage. Smith & Storrs (2023) found that while students valued digital literacies, there was a significant disparity between their perceived importance and the actual instruction received in educational settings. This gap suggested an urgent need for educational reforms to integrate digital literacy more effectively into curricula. Moreover, Karagul and colleagues (2021) identified challenges faced by students during online education due to varying levels of digital literacy, emphasizing the necessity for tailored training programs across all educational levels to prepare students for ongoing digital transformation.

The collective evidence from these studies illustrated that digital literacy is not merely an auxiliary skill but a fundamental component of modern education that significantly influenced students' academic success and their attitudes towards technology-enhanced learning environments. As educational institutions continued to adapt to technological advancements, prioritizing the development of comprehensive digital literacy programs remained vital in equipping students for success in an increasingly digital world.

Operational Skill. The rapid transition to online learning exposed significant gaps in digital skills among both students and teachers, particularly impacting low-income individuals who faced challenges in accessing technology.

Students reported increased anxiety, difficulties in concentration, and a longing for face-to-face interactions, while educators struggled with the abrupt shift, often lacking the necessary training for effective online instruction. This situation highlighted the urgent need for improved digital literacy training and infrastructure in higher education to support all students, especially those from disadvantaged backgrounds (Udeogalanya, 2022).

Moreover, digital education emerged as a transformative force, providing accessibility and flexibility that traditional learning environments often lacked. It allowed students from remote areas to engage with quality educational resources through virtual classrooms and downloadable materials. Key advantages of digital education included cost-effectiveness and global collaboration opportunities, which enhanced student engagement and fostered essential skills such as information literacy and online communication (Nisha & Krishnarajan, 2024). This shift not only prepared students for a technology-driven future but also promoted environmental sustainability by reducing reliance on physical materials.

Additionally, teachers' perceptions of digital literacy were critical for effective teaching practices. Research conducted in Ilorin South, Nigeria, revealed that educators generally viewed digital literacy positively as a relevant teaching tool, although perceptions varied by gender and age. Younger male teachers tended to have more favorable views compared to their female or older counterparts (Agarry et al., 2024). However, this was contradicted by the study

of Cortez and Ponsades (2024), whose research results showed that no direct effect was found between digital literacy skills and teaching performance, and no indirect effect through 21st-century skills. Such initiatives were essential for fostering an inclusive educational environment where all educators could effectively integrate digital tools into their teaching.

According to the study of Nurzhanova and colleagues (2024) in Kazakhstan, pre-service teachers indicated high levels of digital literacy and technology use skills among participants. However, disparities were noted between genders and grade levels, with male participants exhibiting superior technology use skills compared to females. These findings emphasized the importance of developing these competencies for effective technology integration in education. Moreover, research by Anggraeni and colleagues (2023) on Physics Education students at Jember University demonstrated strong digital literacy skills essential for adapting to technological advancements in their field.

Collectively, these studies highlighted the necessity of enhancing digital literacy across educational contexts to ensure that all students were equipped to thrive in a rapidly evolving digital landscape. On the other hand, the implications of inadequate digital literacy extended beyond individual academic performance; they could have long-term consequences for future opportunities. The pandemic exacerbated existing inequalities in education, particularly affecting marginalized groups who struggled with access to technology. Addressing these disparities through enhanced digital literacy training and support systems was

essential for fostering equity in education and ensuring that all students could succeed in a technology-driven world. As educational institutions adapted to this new landscape, prioritizing digital literacy remained vital for preparing students not only for academic success but also for the demands of the modern workforce.

Thinking Skill. In digital literacy, thinking skill is important due to the user's ability to assess information in digital media, particularly in interpreting the information presented and using reasoning to understand the interconnections between concepts. Research conducted in Davao City highlighted a significant positive correlation between digital literacy and critical thinking among Grade 5 learners. This suggested that enhancing digital literacy could potentially foster better critical thinking skills among young learners (Mabini & Gallardo, 2024).

Moreover, the study indicated that while students demonstrated high proficiency in basic digital skills, internet literacy, and digital communication, their thinking skill abilities exhibited moderate proficiency, especially in analysis and evaluation. E-learning methods further supported this by improving both digital literacy and critical thinking through innovative approaches. For instance, the study by Rahayu and colleagues (2022) on a quasi-experimental design comparing STEM-vision e-learning with conventional methods showed that students exposed to the former performed significantly better in both areas. This aligned with findings from the study by Rejeki and colleagues (2022) on online problem-based learning, which also reported substantial improvements

in critical thinking and digital literacy skills among fifth-grade students compared to traditional expository learning methods.

Additionally, thinking skill assessment tools were instruments used to measure the level of critical thinking skills and abilities. They supported active learning, facilitated team-building activities, and fostered peer-to-peer learning. Such tools were essential for evaluating educational outcomes and ensuring that curricula effectively fostered critical thinking alongside digital literacy. A study by Waliyuddin and Sulisworo (2020) introduced a test instrument designed to measure Higher Order Thinking Skills (HOTS) and Digital Literacy Skills (DLS) among high school students. This instrument demonstrated strong psychometric properties, indicating its reliability and validity for assessing these competencies.

By engaging in a project, students were naturally compelled to identify problems, brainstorm solutions, evaluate options, and make decisions. The development of project-based learning resources, such as e-worksheets, showed promise in enhancing students' creative thinking and digital literacy skills. For example, Sari and colleagues (2021) created an e-worksheet focused on sound concepts that integrated physics and biology while promoting hands-on activities. This approach not only engaged students but also aligned with contemporary educational goals of fostering 21st-century skills. However, gender differences revealed that while male students excelled in digital literacy, female students demonstrated stronger science process skills, highlighting the need for

tailored educational strategies (Kurniawan et al., 2023). This was because making conclusions required a reasonably strong interest in theory. A study examining gender differences revealed that female students excelled in science process skills, while male students outperformed in digital literacy.

The interplay between digital literacy and thinking skills were crucial in shaping the educational landscape for learners. The evidence indicated that enhancing digital literacy not only equipped students with essential skills for navigating the digital world but also fostered their critical thinking skill abilities. This relationship was particularly significant in the context of innovative e-learning approaches, which had shown improvements in student engagement and learning outcomes. Moreover, the findings on gender differences underscored the importance of developing tailored educational strategies that addressed the unique strengths and weaknesses of male and female students. By recognizing these disparities, educators could create more inclusive learning environments that promoted equitable skill development. Overall, integrating digital literacy into curricula fostered critical thinking skill, preparing students for complex problem-solving in the digital age.

Collaboration Skill. The increasing digitalization of educational practices meant that students need to develop strong collaboration skills, which were essential for effective teamwork in a digital world. The findings of Purnamasari and colleagues (2021) showed that students' mean percentage score for collaboration skills was a moderate 39.17%, in stark contrast to their mean

percentage score for digital literacy at 54.68%. This disparity highlighted an urgent need for educational institutions to focus not only on technical knowledge but also on fostering collaborative skills essential for thriving in digital environments. Reilly and Leopold (2021) further emphasized that a holistic approach, integrating both skill sets, was vital for preparing students to face future challenges. The implications were clear: educators needed to prioritize the development of collaboration skills alongside digital literacy to cultivate well-rounded learners.

Digital tools played a crucial role in boosting collaboration among students, making their effective use essential for teamwork. Platforms like Slack and Flipgrid had proven to be very effective in promoting communication and idea sharing, helping to create productive teamwork (Vali, 2023; Ojobor et al., 2021). These tools did more than just enable communication; they also supported socio-cognitive processes such as the co-creation of knowledge and the negotiation of meaning. However, the success of these technologies largely depended on how well they were integrated into learning activities (Kwiatkowska & Wisniewska-Nogaj, 2022). Therefore, teachers not only had to adopt these tools but also learn how to use them effectively to boost student engagement and foster teamwork. As time progressed, it became increasingly clear that integrating technology thoughtfully significantly improved the collaborative learning experience.

In addition, the psychological aspects of collaboration, especially in the digital world, played a significant role because they directly influenced team dynamics. Kwiatkowska and Wisniewska-Nogaj (2022) discovered that students with higher levels of digital competence exhibited less anxiety during group work, which boosted their willingness to collaborate. Emotional literacy, highlighted by Ojobor and colleagues (2021), became increasingly recognized as a key part of digital competencies. However, prioritizing a learning environment that nurtured both technical and emotional skills was crucial for successful collaboration. Emphasizing emotional aspects not only created a supportive atmosphere but also empowered students to engage more confidently and effectively. Although this recognition was vital for educators who aimed to create inclusive environments, catering to the diverse emotional and cognitive needs of their students, remained a challenge.

Digital collaboration had many potential advantages. However, significant challenges remained, particularly regarding equal access to digital tools. Cherbonnier and colleagues (2024) argued that simply providing access to digital tools was not enough; educators needed to integrate these tools into collaborative tasks to make them truly effective. If students lacked proper training or support in using these tools, they often became frustrated and disengaged (Vali, 2023). This underscored the importance of being intentional in teaching practices—ensuring that educators were prepared to guide students in using technology. Reflecting on these challenges, it was evident that educators' roles extended

beyond just providing resources; they also needed to actively create a supportive learning environment that fostered effective digital collaboration.

The ongoing digital divide continued to hinder equitable engagement in collaborative learning environments. Purnamasari and colleagues (2021) and Vali (2023) indicated that students with varying levels of digital competence contributed unequally to group efforts, ultimately affecting their collective performance. Cherbonnier and colleagues (2024) and Ojobor and colleagues (2021) argued that addressing this disparity required systemic solutions to ensure equal access to digital resources and collaborative skill development. However, acknowledging these barriers was crucial for educators and policymakers. They needed to work toward creating inclusive environments that enabled all students to thrive in collaborative settings. Although this was challenging, only by collectively addressing these issues could educators foster a more equitable educational landscape that prepared all learners for success in a digital world. Because of this, it was essential to recognize the role of digital skills in modern education.

Awareness Skill. The growing importance of digital literacy awareness in education could not be overstated. It served as the foundation for academic success and prepared students for future challenges. Soeprijanto and colleagues (2022) revealed that digital literacy significantly influenced students' learning achievement, contributing to 50.9% of their success. This highlighted that developing awareness skills was critical, as it enabled students to navigate digital

landscapes effectively. By cultivating these skills, educators helped students leverage technology not just as a tool but also to enhance their overall educational experience.

Additionally, teacher awareness of digital literacy was equally crucial for fostering an effective learning environment. Utami and colleagues (2019) emphasized that when educators possessed strong digital skills, they could integrate technology more effectively into their teaching methods, leading to enhanced student engagement. Aydinlar and colleagues (2023) further supported this notion, advocating for curriculum changes that enhanced digital literacy awareness among both teachers and students. This interconnectedness illustrated that enhancing teacher awareness was fundamental to creating a culture of digital literacy, ultimately benefiting students' learning outcomes.

The disparities in digital literacy awareness, particularly among different genders, highlighted a pressing concern in educational equity. Aydinlar and colleagues (2023) found that female students often possessed lower digital skills compared to their male peers, underscoring the need for targeted interventions. Mardiah and colleagues (2021) advocated for a more effective integration of digital tools in education to bridge these gaps. By addressing these disparities, educational institutions created equitable opportunities for all students, ensuring that everyone was prepared to excel in an increasingly digital world.

Challenges in developing digital literacy awareness reflected broader issues in education that needed to be addressed. Mardiah and colleagues (2021)

pointed out that students often struggled with technology when they lacked a solid foundation in digital literacy. Utami and colleagues (2019) also noted the low motivation among teachers to engage in professional development, which hindered the effective integration of digital literacy. By prioritizing awareness skills, educational systems equipped students with the necessary tools to navigate a complex digital landscape, fostering critical thinking and creativity.

Student-Faculty Interactions

The quality and nature of the student experience in education significantly influenced students' academic success and personal development. Research showed that both frequency and quality of these interactions enhanced student satisfaction, motivation, and retention rates. Effective engagement occurred through informal settings, office hours, and personalized feedback, fostering a supportive learning environment. According to Loes and colleagues (2024), improved student-faculty interactions positively affected persistence from the first to the second year of college, mediated by students' satisfaction with the relationship.

In this regard, Morrison (2021) noted that interaction between students and faculty members within online learning environments led to higher engagement, which ultimately resulted in greater motivation, well-being, and more effective academic performance. These studies supported the argument that there was a dire need for higher education systems to promote beneficial interactions between faculty and students to improve retention and satisfaction.

Student-faculty interaction transformed with technology, primarily in digital learning spaces. Tools like texting and electronic feedback enhanced communication, as demonstrated in the work of Carr and colleagues (2021), who showed how these tools instilled a sense of care and support in students. Harper (2018) conducted a systematic review of studies presenting ways in which technology improved collaboration and engagement, making teaching-student interactions more effective. These findings indicated that lecturers needed to deliberately apply technology in teaching to bridge the communication gap and foster learner involvement.

In addition, affective and psychosocial aspects of lecturer-student interactions had significant implications for learner welfare. Yu and Zhou (2024) revealed that positive relationships with faculty members enhanced student resilience, which contributed to mental well-being. According to Goodman (2022), deep engagement with faculty served as the most essential catalyst of belonging, especially among post-traditional students, whose personal and socio-economic contexts often posed additional challenges. Emotional and psychological dimensions in institutions, therefore, needed to emerge as top priorities, as they were vital to student-faculty interactions and the overall development of students.

However, systemic barriers such as institutional racism and discrimination continued to undermine effective interactions, particularly between faculty members and marginalized student populations. Kim and

Lundberg (2022) pointed out biased perceptions and power imbalances that interfered with meaningful participation, while Park and colleagues (2018) provided empirical evidence showing that experiences of discrimination further strained academic performance, with particularly adverse outcomes in STEM fields. These findings emphasized the urgent need for systemic reforms to ensure an environment where every student could benefit from meaningful faculty interactions.

Cultural and contextual factors also influenced the nature of student-faculty interactions. Ramklass and Vital (2020) elaborated on how historical racial conflicts in South Africa created a sense of "no care" among faculty members toward students, resulting in low-quality interactions. Similarly, Thibault (2024) examined the experiences of international students in Korea and highlighted how language barriers and cultural disparities diminished the quality of faculty-student contact. These research contributions underscored the need to consider and address the diverse cultural backgrounds and needs of student populations to strengthen faculty-student interactions.

New means of enhancing communication also emerged, such as the use of emojis in digital communication, which made interactions more relatable and engaging—an insight put forward by Franzini and Pilli (2024). This perspective suggested that informal communication strategies could create more supportive and interactive learning environments. Furthermore, Dahmani and colleagues (2024) discussed the connection between faculty communication styles, student

proactiveness, and academic discipline, demonstrating that these factors significantly impacted not only student performance but also the quality of interactions. Therefore, faculty development programs aimed at improving communication skills should have been pursued to enhance educational outcomes.

Trust. The key components that determined how student-faculty relationships developed in higher education and, therefore, what communicated between them. The researchers analyzed how trust influenced student engagement, collaboration, and the broader experience of learning from 25 studies.

Trust was a critical consideration in many educational settings, most obviously as it concerned the relationship between students and faculty. The study conducted by Tariq (2023) highlighted the transformative importance of trust in student-faculty partnerships, showing how students, when trusted, contributed meaningfully to course design. This was also aligned with the findings of Iftikhar (2021), stating that trust was crucial in allowing a student to step into the leadership role within a pedagogical partnership, challenging traditional hierarchical educational structures. Both studies highlighted the importance of having faith in students and allowing them to be proactive, quick responders with faculty.

Additionally, trust also performed a crucial role in students' perceptions concerning the quality of relationships with the faculty. Snijders and colleagues

(2020) found that students who received quick responses and felt valued by their teachers developed stronger relationships, suggesting that trust was built through timely and personal engagement. Similarly, Jederlund and Von Rosen (2022) showed that when teachers collaborated and engaged in collective learning, it greatly boosted students' trust and self-efficacy. This reinforced the notion that teamwork among faculty had a positive effect on the student experience.

Trust was a key factor in educational experiences beyond individual relationships. Abdelmaaboud and colleagues (2020) highlighted that institutional trust fulfilled a mediating role in student loyalty and satisfaction, as students who gained a sense of belonging to their university were more likely to represent it. This level of institutional trust corresponded with the research conducted by Nicolo and colleagues (2023), which examined trust in science within university populations, revealing that trust was influenced by demographic factors and underscoring the challenges of fostering trust among varied groups.

In EFL education, trust between teachers and students was connected to student motivation and performance. The significance of trust and respect in increasing student engagement was emphasized in Sabbar's (2024) study, which aligned with the general conclusion of the studies mentioned—that trust was the key to a learning environment that was supportive and productive. It also highlighted the importance of trust and respect in engaging students, which

resonated with the broader sentiment across these studies that trust was the foundational element in creating a supportive and productive educational environment.

Trust created the conditions for the kind of interactions between students and faculty that were productive and beneficial to the educational experience and thus the outcomes. In such a way, a more supportive academic environment was developed. By prioritizing trust, institutions improved student-faculty interaction, motivation, and engagement.

Communication. The studies reviewed provided a comprehensive understanding of communication dynamics in online education, emphasizing the interplay between faculty and students. Effective communication between students and faculty was essential in the digital age, as it significantly influenced academic success and student engagement. With the rise of technology in education, traditional methods of interaction evolved, allowing for more immediate and accessible communication channels. Callo and Yazon (2020) highlighted the importance of readiness for online teaching, revealing that factors like device access and self-efficacy significantly influenced both faculty and student preparedness for digital learning environments. This quantitative approach underscored the need for institutions to assess technological readiness as a foundational step in transitioning to online education.

In contrast, Dhillon and colleagues (2021) focused on communication styles among educators, demonstrating that expressiveness and verbal

aggressiveness impacted teaching effectiveness. Their findings suggested that female teachers tended to excel in listening and conveying messages compared to their male counterparts. This gender disparity in communication effectiveness emphasized the role of personal characteristics in shaping educational experiences.

Furthermore, Bongco and Ama (2023) explored intergenerational communication, revealing that faculty and students adapted their styles based on mutual understanding rather than fixed generational traits. Their qualitative study indicated that effective communication was a collaborative process, which aligned with the findings of Tratnik and colleagues (2023) regarding email interactions. Both studies advocated for a deeper understanding of contextual factors influencing communication to enhance educational outcomes.

Moreover, Bukhori and colleagues (2023) addressed classroom communication challenges faced by engineering students, noting a disparity between students' confidence in giving instructions versus participating in discussions. This highlighted the necessity for targeted support in developing students' public speaking skills, reinforcing the need for educational institutions to prioritize communication training.

Lastly, Carr and colleagues (2021) examined the impact of electronic communication on student-faculty relationships. Their mixed-methods approach indicated that technology fostered a sense of care and improved engagement, suggesting that effective use of digital tools was crucial in modern

education. Together, these studies underscored the multifaceted nature of communication in educational settings, advocating for strategies that enhanced both technological readiness and interpersonal dynamics.

Level of Engagement. The massive focus on student engagement and faculty interactions in higher education called for a range of strategies that boosted learning and satisfaction. Research showed how frameworks improved engagement practices, benefiting both students and faculty. As demonstrated by Leslie (2019), the level of engagement greatly improved online learning environments. The increase in student grades and learning assessments was largely due to faculty training, which laid the foundation for these improvements. Similarly, DiLoreto (2023) found that faculty presence in online courses was crucial, suggesting that students' perceptions of interaction with professors influenced their satisfaction and perceived learning. Both studies concluded that organized faculty development enhanced student achievement by fostering a more engaging online community.

However, faculty-student interactions were not universally effective across all disciplines or student demographics. Wilson and colleagues (2020) found that faculty support in engineering courses boosted student engagement, but the effects varied depending on students' backgrounds. Women and minority students, for example, responded differently to the same support. These findings highlighted the need for personalized engagement strategies, especially in STEM fields, where emotional and behavioral engagement did not automatically follow

faculty support. Such results underscored the need for context-specific engagement approaches, reflecting the previous study on comprehensive faculty development programs.

Moreover, the benefits of strong faculty-student relationships extended to both engagement and academic success. Mattanah and colleagues (2024) found that strong relationships between students and faculty fostered deeper engagement, leading to advanced learning strategies. This aligned with Snijders and colleagues (2020), who found that the quality of student-faculty relationships significantly influenced student loyalty and engagement. Together, these studies suggested that building strong interpersonal relationships in educational settings not only benefited students academically but also contributed to institutional loyalty and retention.

For international students, faculty-student interactions posed unique challenges. Wang and BrckaLorenz (2024) revealed a significant gap between international students' perceptions of engagement and faculty expectations. This discrepancy, particularly regarding collaborative learning, emphasized the need for faculty to adapt their teaching methods to support diverse student populations. This also highlighted the broader issue of misalignment between faculty beliefs and student experiences, reinforcing the importance of faculty adaptability to meet varied student needs.

Furthermore, learning analytics emerged as a valuable tool for improving engagement strategies. Oladipupo and Samuel (2024) demonstrated how data-

driven approaches enhanced student-faculty interactions by providing insights into student perceptions of engagement. This suggested that faculty could use learning analytics to fine-tune their teaching methods, resulting in a more supportive and effective learning environment.

These studies highlighted the need for faculty development around engagement approaches that were attuned to diverse student populations. These included relationship formation, personalized support, and data-informed practices that faculty used to shape learning experiences and ultimately influence student outcomes. While multiple studies supported these conclusions, they also indicated the need for further research to validate these findings on a wider scale and ensure that engagement strategies were adaptable to various disciplines and student demographics.

Collaborative Outcome. Developing collaborative skills in student-faculty relationships was crucial for a supportive academic environment. By improving these skills, educational institutions enhanced student engagement, accountability, and overall academic success. Brand (2020) emphasized that professional development programs integrating NGSS techniques boosted student engagement and understanding of scientific concepts. These claims were supported by Nurdiana and colleagues (2023), whose findings showed that collaborative digital education partnerships at the Institute of Islamic Religion of Sultan Muhammad Syafiuddin Sambas enhanced student outcomes by increasing engagement and motivation. Both studies emphasized the importance

of collaboration in improving teacher effectiveness and student outcomes while noting areas for improvement, such as communication and coordination.

Moreover, the design of learning spaces played an important role in shaping the educational experience. Creating environments that encouraged interaction, and active participation transformed the way students engaged with the material and with each other. The study by De Borba and colleagues (2019) argued that well-designed learning spaces significantly enhanced educational outcomes. The authors emphasized that both physical and virtual environments were crucial in promoting active participation and communication among students and instructors, thereby facilitating collaborative learning experiences. By fostering a sense of community and collaboration, these environments enhanced not only academic outcomes but also the overall learning journey.

Additionally, integrating practical, collaborative, and reflective practices into curricula significantly enhanced student engagement, learning outcomes, and overall educational quality. McMillan and colleagues (2020) implemented interventions in a nursing program, focusing on infection control, tougher exams, and interdisciplinary partnerships, leading to better student performance, a cultural shift, and more faculty involvement. Similarly, Mora and colleagues (2019) found that peer review in engineering education boosted motivation, engagement, understanding, access to quality sources, writing skills, document structure, active learning, critical thinking, collaboration, overall

learning outcomes, and work quality. Both studies highlighted the importance of targeted interventions and active learning strategies in higher education.

Furthermore, Anwar and colleagues (2021) investigated the perceptions of students regarding collaborative team teaching between university lecturers and high school teachers on Bawean Island, Indonesia. The study suggested that further research was necessary to fully understand the long-term impacts of this teaching approach. Mari and colleagues (2021) found that student-faculty partnerships with active involvement and shared responsibility enhanced students' collaboration skills, engagement, and accountability. While both studies advocated for collaborative approaches, they also highlighted the need for ongoing research and adaptation to ensure these methods were effective and sustainable in the long run.

These studies highlighted the crucial role of collaboration in enhancing educational outcomes. Whether through professional development programs, well-designed learning spaces, practical and reflective curricula, or collaborative teaching methods, fostering collaboration significantly boosted student engagement, accountability, and academic success. However, ongoing research and adaptation were essential to ensure these methods remained effective and sustainable. By integrating these collaborative strategies, educational institutions created a more supportive and dynamic academic environment, enriching the overall learning journey for students.

Correlation Between Digital Literacy and Student-Faculty Interactions

The relationship between digital literacy and student-faculty interaction was crucial for fostering effective learning environments in education. As digital platforms became more integral to educational methods, understanding how these skills affected communication and engagement became vital.

Digital literacy influenced student-faculty interactions, greatly improving communication, engagement, and learning outcomes. Tewari and Biria (2018) found that greater use of digital tools led to better faculty-student interaction and classroom experiences. This highlighted the need for faculty to boost their digital literacy to engage with diverse student populations. Boateng and colleagues (2019) added that students preferred online platforms for academic communication outside the classroom, such as WhatsApp, emphasizing convenience and effectiveness in improving student success.

In addition to convenience, digital literacy fostered self-regulation and engagement in online learning. Kayaduman and colleagues (2022) found that students with strong digital literacy self-regulated better, becoming more active in online learning spaces. This was aligned with the study of Getenet and colleagues (2024), who noted that students' digital literacy skills increased self-efficacy and faculty interaction, leading to more meaningful virtual classroom engagements. These findings showed that higher student digital literacy not only improved online learning access but also enhanced communication with instructors.

Moreover, the digital literacy of faculty greatly affected mentorship and the quality of student-faculty interactions. Machado (2024) highlighted that those digital co-mentoring spaces enhanced faculty-student collaboration and productivity. By integrating digital tools, faculty created more supportive learning environments that connected theory with practice. This was supported by Ulya and Fitri (2024), who stated that lecturers promoting digital platforms enhanced students' digital literacy and improved adaptive learning environments.

In hybrid and inclusive learning environments, digital literacy was crucial for student engagement. Smith (2018) found that digital tools in hybrid learning enhanced student-faculty communication and collaboration. Similarly, Cotán and colleagues (2021) noted that technology increased content access and engagement for students with disabilities, benefiting all learners by promoting inclusive practices. These studies suggested that digital literacy not only improved communication but also fostered diverse learning experiences.

In virtual contexts, navigating digital platforms strengthened student and faculty interactions. Smith and Storrs (2023) showed that students with higher digital literacy engaged more with faculty, creating a communication-learning cycle. This was supported by Nikou and Aavakare (2021), who found that digital literacy led to more meaningful student-faculty interactions and better learning outcomes. Both studies found that digital literacy enhanced self-efficacy, making students more likely to seek help and participate.

Additionally, Reece (2024) explored how differing perceptions of online interactions affected educational experiences. Digitally literate faculty better understood student needs and fostered engagement, improving online communication. This was emphasized by enhancing both teacher and student digital literacy to ensure effective communication and learning in digital environments. These findings underlined the importance of digital literacy in establishing healthy student-faculty connections in the virtual classroom.

Digital literacy was not only vital for educational success but also for personal and professional development. Marin and Castaneda (2023) emphasized that digital literacy was crucial for active citizenship and social inclusion in the digital age. Faculty empowered students to navigate the digital world and prepared them for future opportunities by fostering digital literacy. Istifci and Goksel (2022) also highlighted its role in improving self-regulation in open education settings, reinforcing its importance in enhancing both student-faculty interactions and educational outcomes.

In the context of education, digital literacy emerged as a critical competency that was effectively understood and implemented. This skill set enhanced the interaction between students and faculty, leading to improved efficiency and inclusivity in educational processes. The collective findings from various studies emphasized the need for continuous improvement of digital capabilities among both students and educators. This development was crucial

for supporting sustainable growth in dynamic, transnational learning communities within the global educational landscape.

Theory Base

The Constructivist Learning Theory (CLT), developed by Jean Piaget, Lev Vygotsky, John Dewey, and Jerome Bruner in the early 20th century, was the theory that most closely matched to the development of a theoretical framework for researching the relationship between digital literacy and student-faculty interaction.

Constructivist Learning Theory (CLT) emphasized that learners actively constructed their own understanding and knowledge through experiences and interactions, making it particularly relevant in the context of digital literacy and student-faculty interaction. According to Arends (1998), CLT posited that knowledge was not passively received but actively built by the learner as they engaged with new information, reflected on their prior experiences, and collaborated with others. It emphasized the importance of social interactions and personal experiences in the learning process, allowing students to build their knowledge through exploration and reflection (Mascolo & Fischer, 2005).

Constructivism encompassed various approaches, including cognitive and social constructivism, which highlighted different aspects of how knowledge was constructed (Carswell, 2001).

Digital literacy was a crucial competency in the technology-driven world, as it equipped students with the skills to effectively find, evaluate, create, and

communicate information using digital tools. It enhanced critical thinking, enabling students to assess the credibility of online sources and engage responsibly in digital environments (Deady, 2020).

Moreover, Tiwari and Berla (2018) highlighted that faculty members with high digital literacy enhanced student engagement by providing timely feedback and fostering better communication, which was crucial for effective learning experiences. Students, particularly from tech-savvy backgrounds, benefited from interactive digital tools that facilitated collaboration and creativity in learning (McGuinness & Fulton, 2019).

Aside from Constructivist Learning Theory (CLT), several frameworks had also matched for this study. One significant framework was the Engagement and Technology Integration Theory, developed by Gunuc in 2017. It emphasized that effective technology integration was linked to improved student success and learning outcomes by fostering psychological, cognitive, affective, and behavioral engagement in academic and social activities both inside and outside the classroom (Yilmaz, 2021).

Moreover, another model that correlated with Constructivist Learning Theory (CLT) was Participatory Culture, introduced by Henry Jenkins in 2006. This concept highlighted how digital technologies fostered collaborative engagement among users. Participatory culture emphasized collective knowledge creation and sharing through social networks, where individuals contributed to content generation and discourse (Jenkins, 2006). This idea illustrated how

participatory culture could enhance the principles of constructivist learning by promoting engagement and collaboration.

Constructivist Learning Theory (CLT) emphasized that students actively constructed knowledge through experiences and interactions, which was crucial in enhancing digital literacy. This approach promoted collaborative learning and critical thinking, essential for navigating digital environments effectively. Technological tools facilitated access to information and fostered communication, enabling students to engage more deeply with content and peers.

As students utilized digital platforms, they developed skills to critically analyze and synthesize information, reinforcing their learning processes and enhancing their overall digital competence. CLT was used in this study to foster active engagement, collaboration, and critical thinking, enabling students to construct knowledge through meaningful social interactions and technology-enhanced experiences. The study used Constructivist Learning Theory (CLT) to assess how collaborative learning and critical thinking influenced digital literacy and student-faculty interaction.

Conceptual Framework

The conceptual framework below illustrated how digital literacy relates to students-faculty interaction. According to Kivunja (2018), a conceptual framework was a structured outline that helped researchers understand and

analyze their study's problem by connecting key concepts and relationships of variables, serving as a guideline for the research process.

The independent variable in the study was digital literacy, which included operational, thinking, collaboration, and awareness skills, with a focus on individual behavior through the Constructivist Learning Theory (CLT). It was expected that each characteristic of the independent variable had a link to the effectiveness of student-faculty interactions.

Additionally, the dependent variable was student-faculty interactions, which included trust, communication, student engagement, and collaborative outcomes. When a student engaged with faculty, they expressed their trust in the faculty's integrity and competence. Communication between students and faculty, on the other hand, referred to the exchange of information, questions, and feedback, which was essential for fostering engagement, understanding, and academic success. Student engagement with faculty referred to the active participation and involvement of students in their interactions with faculty members, encompassing emotional, behavioral, and cognitive dimensions. Moreover, collaborative outcomes referred to the positive results and benefits that arose from cooperative engagements between students and faculty members, which often enhanced academic performance, increased student engagement, and improved satisfaction with the educational experience.

The conceptual framework demonstrated the correlation between digital literacy and student-faculty interaction, emphasizing how digital skills could

improve communication and collaboration in an academic setting. As students enhanced their digital literacy skills—for example, developing strong operational skills in using digital tools to communicate and collaborate in both online and offline academic environments—they were more likely to engage in meaningful and productive interactions with faculty, improving both academic engagement and collaborative outcomes.

Figure 1. The conceptual framework shows the relationship between digital literacy and student-faculty interaction.

Figure 1 visually demonstrates the relationship between digital literacy and student-faculty interaction, highlighting it as a foundation for understanding how digital competencies enhanced students' ability to engage effectively in academic relationships. With the rapid growth of digital technology, educational institutions increasingly emphasized digital literacy as a core skill. This framework guided the research in examining whether enhancing digital literacy skills among students led to more effective and meaningful interactions

with faculty, ultimately benefiting students' academic success and overall educational experience.

Chapter III

METHODOLOGY

This chapter outlined the techniques employed by the researchers to complete the study. These methods addressed the research design, study population, data collection methods, research instrument creation and validation, data presentation, data analysis, and appropriate statistical handling of the data.

Design

The researchers employed quantitative research methods to gather and analyze numerical data for testing hypotheses or predictions. The quantitative method analyzed numerical data through statistical techniques, allowing them to rationalize the findings for a larger population (Bhandari, 2020). This approach calculated correlation coefficients to quantify the strength and direction of the relationships, helping researchers to understand how changes in one variable are related to changes in another (Fleetwood, 2021).

In addition, the study utilized a descriptive correlational research design to fulfill its objectives. This quantitative approach aimed to provide a detailed snapshot of a situation while simultaneously examining the relationships between two or more variables (Miksza et al., 2023). According to Bhat (2017), the descriptive-correlational research design was particularly effective for examining relationships between variables, as it allowed researchers to observe and describe how two or more variables are related to each other without

manipulating them. By employing statistical methods, researchers quantified the strength and direction of these relationships, making it a valuable tool for generating hypotheses and guiding further research (Haug, 2020).

Furthermore, the researchers employed statistical techniques to analyze the gathered data through a survey tool. The study used this instrument to determine any significant relationship between digital literacy and student-faculty interactions.

The descriptive survey used a Likert scale questionnaire to collect data. This type of questionnaire was vital in descriptive correlational studies for measuring attitudes, opinions, and behaviors quantitatively, allowing researchers to capture the intensity of responses on a continuum, enhancing the richness of the data collected (Croasmun & Ostrom, 2011). This was aligned to the study of Tewari and Birla (2018) who examined the relationship between digital literacy and student-faculty interactions using a Likert scale and found that faculty's digital skills enhanced accessibility and communication, significantly impacting students' learning experiences.

This study provided valuable insights, especially regarding respondents' digital literacy and their engagement in student-faculty interactions. This facilitated a better understanding of how these variables interacted and enhanced the research as intended. The findings contributed to a greater understanding of the relationship between digital literacy and student-faculty interactions, which could assist in developing a more effective and engaging

educational environment by fostering more accessible and transparent communication.

Sampling

In selecting a viable sampling approach for this investigation, the researchers chose probability sampling. It is a process that employs random selection to ensure that every member of the population had an equal chance of inclusion in the sample (Alvi, 2016).

It differed from non-probability sampling approaches, which used a subjective selection procedure rather than known probabilities. Nikolopoulou (2023) suggested that probability sampling provided a good foundation for drawing conclusions about the overall population based on sample characteristics. This strategy was highly effective for achieving generalizability and statistical validity.

Among the numerous probability sampling methods, the researchers employed stratified sampling, a probability sampling method known for its effectiveness in representing diverse subgroups within a population. According to Babbie (2020), stratified sampling ensured that each subgroup, or stratum, was proportionately represented, which enhanced the accuracy and reliability of findings across varied segments of a population. In this case, the clusters corresponded to the numerous senior high school sections of Tibanban National High School.

Moreover, stratified sampling was an effective technique for obtaining a representative sample when the population had identifiable subgroups that differed in significant ways (Etikan & Bala, 2017). Within the framework of the study, each section (e.g., Grade 11-Laurel, Grade 11-Quezon) was divided into strata based on relevant characteristics, such as academic department. Rather than selecting specific participants, the researchers randomly selected participants from each section (stratum), ensuring that every section was proportionally represented in the sample.

The naturally occurring subgroups within the population, specifically the sections within Grade 11 and Grade 12, served as the foundation for the stratified sampling process. As a result, the researchers guaranteed proportional representation of the subgroups, which enhanced the sample's overall representability and reduced the chances of sampling bias (Babbie, 2020). Moreover, stratified sampling was useful in providing diversity among the sample, as each stratum comprised individuals with different characteristics relevant to the study.

For determining the sample size, the researchers applied Slovin's formula to accommodate the study's scope while maintaining statistical rigor. Slovin's formula provides a practical means of calculating sample size when working with large populations and a specified margin of error (Urdan, 2017). By applying this formula, the researchers ensured a manageable sample size that still provided reliable data. According to Weisstein (2023), Slovin's formula was especially

helpful when studying large, diverse populations where gathering data from every member would have been impractical.

The combination of stratified sampling and Slovin's formula reflected a methodical approach to data collection, aligning with Saunders and colleagues' (2019) recommendation for structured sampling methods in social science research. This approach provided a robust framework for generalizing findings across the population, given the study's focus on digital literacy and student-faculty interactions.

Table 1 presents the distribution of respondents among the various sections of senior high school students of Tibanban National High School. Using Slovin's formula, one hundred sixty-six (166) out of two hundred eighty-four (284) senior high school students were chosen as respondents, with each section's distribution determined according to its population size.

This strategic approach fostered a diverse and comprehensive sample by ensuring proportional representation from all eight sections, covering both Grades 11 and 12. By dividing the population into these distinct strata based on grade level and section, the researchers ensured that the sample accurately reflected the structure of the entire student body. The chosen sample sizes were intended to maximize statistical reliability while overcoming practical issues, thus improving the validity of the research and ensuring that its results were substantial and applicable to the wider population.

Table 1. The Research Respondents of the Study

RESPONDENTS	POPULATION SIZE	SAMPLE SIZE
Grade 11- Laurel	36	21
Grade 11- Quezon	50	29
Grade 11- Roxas	34	20
Grade 11- Quirino	34	20
Grade 12- Macapagal	17	10
Grade 12- Duterte	34	20
Grade 12- Marcos	40	23
Grade 12- Garcia	39	23
TOTAL	284	166

Data Collection

When collecting the data, the researchers used the following procedures:

Asking permission for the conduct of the study. The researchers aimed to explore the intricate relationship between digital literacy and student-faculty interaction. This process began with obtaining necessary permits from relevant authorities. A formal letter of intent was submitted to the School Principal of Tibanban National High School to seek approval for the program (see Appendix A). Following the approval, the advisers of participating sections received a letter requesting senior high school students' participation in the survey (see Appendix B). This study adhered to confidentiality protocols in accordance with

established ethical guidelines, ensuring the protection of participants' data and maintaining the highest standards of research integrity.

Before participating, respondents were provided with informed consent by signing forms that detailed the study's objectives, methods, and confidentiality measures. Only after obtaining respondents' consent did data collection begin. Respondents were encouraged to engage in the survey as openly and truthfully as possible, as the information collected was essential for completing the study. Throughout the study, the researchers ensured that the identities of the respondents remained confidential to protect their security and privacy. The researchers handled all information with the highest level of care to always safeguard the participants' rights and well-being.

Administration and retrieval of the research instrument. The researchers personally administered the research instrument. Due to the varying class schedules of the respondents, they conducted face-to-face sessions at different times. Classroom visits accommodated these varied schedules, and an orientation was provided to respondents before distributing the questionnaires via Google Forms. The researchers assisted the respondents and ensured that the responses were original and not copied from one another. The researchers retrieved the completed questionnaires on the specified date. Strict measures were in place to guarantee the authenticity of the responses, and the questionnaires were carefully audited upon their return.

Research Instrument. The researchers adapted and modified the data collection tool for the study. This tool was selected because it aligned well with the study's goals and the type of data being gathered. The instrument consisted of three sections: the first section included informed consent, while the second section asked for the respondent's demographic information, such as their name (optional) and grade level.

The final section of the instrument was adapted from the research titled *Digital Literacy of Faculty & Its Relationship with Teaching Learning*, which examined how faculty digital skills impacted student interactions. This study emphasized the importance of digital literacy in enhancing accessibility and transparency in faculty-student communication. It identified key areas such as real-time feedback and collaborative learning, asserting that a digitally literate faculty significantly improved the overall educational experience for students. The instrument was modified to ensure relevance and applicability within varied educational contexts, particularly in fostering effective teaching methodologies which contains eight subscales: operational skills, thinking skills, collaboration skills, awareness skills, trust, communication, level of engagement and collaborative outcome (see Appendix C).

Validity. This concept served as a critical criterion for evaluating the quality of research. When assessing the technical quality of a test or research study, validity emerged as the most crucial aspect to consider. It ensured that the findings genuinely reflected the phenomena being investigated, which was

essential for drawing reliable conclusions and making informed decisions (Stewart, 2024). In other words, validity guaranteed that the instrument accurately assessed what it was intended to assess.

Validity in research ensured that interpretations of collected data were accurate and relevant, leading to credible conclusions. Therefore, it was essential to conduct a comprehensive assessment of validity to ensure that interpretations were precise, and that the overall quality of the study's findings was upheld.

In this study, the research instrument underwent a validity assessment conducted by experts. A formal letter of communication was dispatched to the selected validators (see Appendix D). Their evaluations and suggestions were included with a validation sheet, which aided in enhancing the instrument (see Appendix E).

Data

This research utilized quantitative data to thoroughly examine and interpret the results. As noted by Creswell (2014), quantitative data encompassed numerical information that could be measured and subjected to statistical analysis to evaluate hypotheses or uncover patterns and relationships among different variables. This type of data typically included measurable factors such as performance metrics, income brackets, and demographic information. Given that quantitative data was based on objective measurements, it enabled researchers to formulate conclusions grounded in statistical evidence, thereby

providing a strong framework for comprehending the relationships between variables (Babbie, 2020).

Data for this study was collected through a survey questionnaire distributed to senior high school students of Tibanban National High School, situated in Barangay Tibanban, Governor Generoso, Davao Oriental. According to Fowler (2014), a survey questionnaire was a structured instrument designed to collect data by presenting respondents with a series of predefined questions or statements, which could be answered in various formats, including multiple-choice, Likert scales, or open-ended responses. The data obtained through this survey aimed to explore the relationship between students' digital literacy levels and their perceptions of faculty interaction.

A 5-point Likert scale was used to assess the connection between students' digital literacy skills and their engagement with faculty. According to Boone and Boone (2012), Likert scales were commonly employed in research to gauge the level of agreement or disagreement with particular statements, offering researchers ordinal data that represented respondents' attitudes and perceptions. This approach allowed the study to explore correlations between variables, identify trends, and evaluate how digital literacy impacted student-faculty interactions.

The survey questionnaire for this study included several statements or questions designed to assess both digital literacy and student-faculty interaction, followed by a 5-point rating scale. Each item in the survey was rated

on a scale of 1 to 5, with 5 signifying Very High, 4 indicating High, 3 denoting Moderate, 2 for Low, and 1 representing Very Low.

Table 2. Parameter Limits, Scale, Corresponding Descriptive Equivalents and its Interpretation for Independent Variable

PARAMETERS LIMIT	SCALE	DESCRIPTIVE EQUIVALENT	INTERPRETATION
4.20-5.00	5	Very High	Individuals possess advanced skills in navigating, evaluating, and creating digital content, with strong technical and cognitive abilities to use tools effectively.
3.40-4.19	4	High	Individuals are proficient in using digital tools to access, evaluate, and create information in a technology-driven environment.
2.60-3.39	3	Moderate	Individuals have basic skills in using digital tools but may struggle with complex tasks like critical evaluation or advanced content creation.
1.80-2.59	2	Low	Individuals have limited digital skills, hindering their ability to effectively access and use information.
1.00-1.79	1	Very Low	Individuals lack fundamental digital skills, restricting their ability to navigate tools, access information, or communicate online.

The respondents were then asked to rate their levels of digital literacy and the extent of their interaction with faculty using a predetermined scale ranging from 1 to 5. Tables 2 and 3 presents the parameter limits, scale, descriptive equivalents, and interpretations for assessing students' digital literacy and student-faculty interaction, respectively.

Table 3. Parameter Limits, Scale, Corresponding Descriptive Equivalents and its Interpretation for Dependent Variable

PARAMETERS LIMIT	SCALE	DESCRIPTIVE EQUIVALENT	INTERPRETATION
4.20-5.00	5	Very High	Students frequently interact with faculty, benefiting from meaningful communication that enhances engagement, feedback, and collaborative learning.
3.40-4.19	4	High	Students engage regularly with faculty, receiving valuable feedback and support that enriches their educational experience.
2.60-3.39	3	Moderate	Students occasionally interact with faculty, gaining some support and feedback but lacking deeper engagement.
1.80-2.59	2	Low	Students have infrequent communication with faculty, limiting feedback and personalized academic support.
1.00-1.79	1	Very Low	Students experience minimal interaction with faculty, impeding their academic growth and access to essential guidance.

Presentation

After data retrieval process, the information was carefully organized and analyzed using statistical methods. The purpose of this thorough processing was to extract meaningful insights from the data, ensuring a reliable and informed interpretation of the collected information.

Analysis

In the analytical phase, the survey questionnaires were carefully assessed,

focusing particularly on the respondents' answers to each question. This included reviewing response patterns, identifying potential biases, and ensuring that all data were relevant and complete for accurate analysis. The data was gathered from both the independent and dependent variables and analyzed using suitable statistical techniques aligned with the study's goals. These methods allowed for a comprehensive understanding of the relationships between the variables.

The analysis of the collected data was carried out in accordance with the specified objectives. Three distinct objectives were established, and appropriate statistical tools were employed to address them. Each objective guided the choice of specific analysis techniques, ensuring that the findings were robust and directly relevant to the research questions.

For objective number one, the mean and standard deviation was utilized to determine the level of senior high school student's digital literacy.

For objective number two, the mean and standard deviation was used to determine the level to which senior high school students intend to engage in student faculty interactions.

For objective number three, the research employed Spearman's rho correlation to evaluate whether there are any correlations between digital literacy and student-faculty interactions. The categories proposed by Bluman (2009) will be used to interpret the findings. The table provided below shows the interpretation of the result, as well as the suggested categorical description.

Table 4. Interpretation and Categorical Description

± 1.00	Perfect
$\pm 0.80 - \pm 0.99$	Very Strong
$\pm 0.60 - \pm 0.79$	Strong
$\pm 0.40 - \pm 0.59$	Moderate
$\pm 0.00 - \pm 0.39$	Low

Ethical Consideration

Before initiating the research study, all potential participants received a comprehensive briefing that outlined the study's purpose and objectives. The researchers took care to obtain all necessary permissions from relevant authorities, including a formal letter of approval from the School Head of Tibanban National High School.

To highlight the significance of voluntariness, informed consent materials were provided to all prospective respondents, enabling them to make an informed and independent choice regarding their participation in the study. This principle underscored the ethical basis of the research, recognizing the importance of individual autonomy in deciding to take part.

In compliance with RA 10173, known as the Data Privacy Act, rigorous measures were in place to ensure anonymity, confidentiality, and the mitigation of any potential harm. Protecting participants' information was a top priority,

and the researchers were committed to maintaining strict protocols that prevented the disclosure of participants' names and identities.

Additionally, researchers took steps to minimize any potential harm that could arise during the study. This included creating a safe and respectful research environment where participants felt comfortable expressing their views. In cases where respondents experienced discomfort or had concerns regarding their participation, support mechanisms were available to address their needs. The ethical commitment to reducing risks and helping reinforced the study's dedication to participant well-being.

Lastly, to maintain ethical responsibility and transparency, relevant authorities were regularly updated on the study's progress and any important findings. The involvement of school officials ensured that the research adhered to institutional guidelines and best practices. By maintaining open communication with authorities and prioritizing participant welfare, the study upheld ethical research standards while fostering trust among the respondents and the broader school community.

CHAPTER IV

RESULTS AND DISCUSSION

In this chapter, the researchers carefully examined the data collected from the respondents. The problem statement in the discussion was strategically framed to reflect the responses received, thereby shaping the organization of the analysis.

The Extent of Digital Literacy

The extent of digital literacy refers to the level of knowledge, skills, and competencies individuals have in using digital technologies effectively. It includes the ability to access, evaluate, create, and communicate information using digital platforms. Digital literacy plays a crucial role in various aspects of life, including education, work, and online transactions. A higher level of digital literacy enables individuals to navigate digital environments with confidence, while a lack of it may lead to difficulties in accessing reliable information, managing online security, or utilizing digital tools efficiently.

Table 5 presents the extent of digital literacy in terms of operational skills. It is a significant skill to effectively navigating modern technology, from using basic software to managing digital security. Strong operational skills enable individuals to efficiently complete tasks, troubleshoot issues, and adapt to new digital tools in both personal and professional settings. As technologies continues to evolve, these skills are essential for productivity, communication and staying competitive in the digital world.

Table 5. The Extent of Digital Literacy of Senior High School Students in terms of Operational skills

DESCRIPTION	MEAN	SD	DESCRIPTIVE EQUIVALENT
Students who know how to use wide range of strategies when searching for information.	3.43	0.86	High
Students who know some good ways to avoid computer viruses.	3.12	1.00	Moderate
Students have no problem finding way around a website.	3.34	0.86	Moderate
Students who know how to use shortcut keys.	3.30	1.02	Moderate
Students who know how to change the content they shared (e.g., friends, friends of friends or public).	3.81	0.92	High
Operational Skills	3.40	0.93	High

The results in Table 5 indicate varying levels of operational skills among students. The statement with the highest mean value of 3.81 and a standard deviation of 0.92 pertains to students knowing how to change the content they share, which corresponds to a descriptive equivalent of *High*, highlighting that students are proficient in using digital tools in terms of operational skills. Similarly, students' ability to use a wide range of strategies when searching for information has a mean value of 3.43 and a standard deviation of 0.86, also categorized as *High*.

On the other hand, students' knowledge of ways to avoid computer viruses has the lowest mean value of 3.12, with a standard deviation of 1.00, which falls under the *Moderate* category. Likewise, navigating a website with a mean of 3.34 and a standard deviation of 0.86 and the proficiency in using shortcut keys resulted a mean of 3.30 and a standard deviation of 1.02 are also classified as *Moderate*.

The overall mean for operational skills was 3.40, with a standard deviation of 0.93, indicating a *High* level of proficiency among students. This highlights that students are proficient in using digital tools in terms of operational skills, which suggests that while students generally demonstrate competence in operational skills, there is room for improvement, particularly in areas related to cybersecurity awareness and technical shortcuts.

These findings align with previous research by Van Deursen and Van Dijk (2016), which emphasized that while digital literacy among students is increasing, gaps remain in technical proficiency and cybersecurity knowledge. Furthermore, a study by Eshet-Alkalai (2019) highlighted that digital literacy consists of multiple dimensions, including technical, informational, and social skills, suggesting that while students may excel in certain areas, they may require additional training in others.

The results underscore the need for educational institutions to integrate digital literacy programs that not only enhance students' ability to search and

share content but also strengthen their technical and security-related competencies.

Table 6 shows the extent of digital literacy in terms of thinking skills. It is essential for analyzing information, solving problems, and making informed decisions in a digital environment. It enables individuals to critically evaluate online content, recognize biases, and apply logical reasoning when using technology. Developing these skills is crucial for adapting to the fast-changing digital landscape and effectively engaging with digital tools and media.

Table 6. The Extent of Digital Literacy of Senior High School Students in terms of Thinking skills

DESCRIPTION	MEAN	SD	DESCRIPTIVE EQUIVALENT
Can evaluate the credibility of online sources.	3.64	0.96	High
Confident to find solutions online when faced with a technical issue.	3.32	0.91	Moderate
Can effectively integrate information from multiple digital sources.	3.39	0.90	Moderate
Can make informed decisions based on digital information.	3.43	0.84	High
Able to make informed decisions based on digital information.	3.48	0.99	High
Thinking Skills	3.45	0.92	High

In the table, it was found that respondents generally agree with the statement that they can evaluate the credibility of online sources, as this statement corresponds to the highest mean value of 3.64 and a standard deviation of 0.96. This indicates a descriptive equivalent of *High*, suggesting that students possess a strong ability to assess the reliability of digital information.

On the other hand, the ability to make informed decisions based on digital information has a mean value of 3.48, with a standard deviation of 0.99, also categorized as *High*. Similarly, another statement regarding informed decision-making based on digital information holds a mean value of 3.43 and a standard deviation of 0.84, also classified as *High*, reinforcing that students generally feel confident in their ability to critically analyze online content before making decisions.

However, confidence in finding solutions online when faced with technical issues has a mean value of 3.32 and a standard deviation of 0.91, which corresponds to a descriptive equivalent of *Moderate*. Likewise, the ability to integrate information from multiple digital sources has a mean value of 3.39, with a standard deviation of 0.90, also classified as *Moderate*. These results indicate that while students can generally analyze and evaluate online information, their ability to synthesize multiple sources and troubleshoot technical problems is comparatively weaker.

Overall, the mean for thinking skills is 3.45, with a standard deviation of 0.92, corresponding to a descriptive equivalent of *High*. This highlights that students are proficient in using digital tools in terms of thinking skills, which emphasizes that students have a relatively strong ability to critically assess and utilize digital information effectively.

These findings align with previous research by Metzger and Flanagin (2013), who emphasized the growing importance of digital literacy in evaluating

online information. Their study highlighted that while students are becoming more adept at distinguishing credible sources, there are still challenges in navigating the vast amount of digital content available. Furthermore, a study by Wineburg and McGrew (2019) found that many students struggle with lateral reading, an essential skill for verifying online information.

The results suggest a need for further digital literacy training, particularly in enhancing students' ability to integrate multiple sources and develop problem-solving strategies in digital environments. Strengthening these areas can improve their overall competency in navigating the complexities of online information.

In Table 7, digital literacy in terms of collaboration skills is presented, where it highlighted the significance of collaboration skills for effective teamwork in today's interconnected world. It enables individuals to communicate, share ideas, and work seamlessly across digital platforms, enhancing productivity and innovation. Strong collaboration skills in a digital environment foster global connections, streamline remote work, and ensure efficient problem-solving in both academic and professional settings.

In the table, it was found that respondents generally agree with the statement that they can confidently use digital tools such as Google Docs and Zoom for collaboration, as this statement corresponds to the highest mean value of 3.45 and a standard deviation of 0.88. This indicates a descriptive equivalent

of *High*, suggesting that students are comfortable using online platforms to work with others.

Table 7. The Extent of Digital Literacy of Senior High School Students in terms of Collaboration Skills

DESCRIPTION	MEAN	SD	DESCRIPTIVE EQUIVALENT
Can collaborate with peers using digital tools.	3.43	0.86	High
Confident in using digital tools (e.g., Google Docs, Zoom) for collaboration.	3.45	0.88	High
Can effectively communicate during digital collaborative projects.	3.30	0.81	Moderate
Actively seek and value feedback from peers enhances digital collaboration.	3.42	0.92	High
Can comfortably resolve conflicts contributes to successful digital teamwork.	3.31	0.84	Moderate
Collaboration Skills	3.38	0.86	Moderate

Similarly, the ability to collaborate with peers using digital tools holds a mean value of 3.43, with a standard deviation of 0.86, also categorized as *High*. Likewise, actively seeking and valuing feedback from peers to enhance digital collaboration has a mean value of 3.42 and a standard deviation of 0.92, reinforcing that student recognize the importance of constructive feedback in digital teamwork.

On the other hand, effective communication during digital collaborative projects has a mean value of 3.30, with a standard deviation of 0.81, which corresponds to a descriptive equivalent of *Moderate*. Additionally, the ability to

resolve conflicts comfortably in digital teamwork has a mean value of 3.31 and a standard deviation of 0.84, also categorized as *Moderate*. These results suggest that while students generally have basic skills and confidence in using digital tools, their ability to communicate effectively and manage conflicts in virtual collaborations requires further development.

Overall, the mean for collaboration skills was 3.38, with a standard deviation of 0.86, corresponding to a descriptive equivalent of *Moderate*. This emphasizes that students have basic collaboration skills, which suggests that they possess a reasonable level of these digital competencies but may need additional support to enhance their communication and conflict resolution abilities in online settings.

These findings align with the study of Kim and colleagues (2020), which emphasized the increasing reliance on digital tools for collaboration in academic and professional settings. Their research highlighted that while digital platforms facilitate teamwork, effective communication and conflict resolution remain challenges for many students. Furthermore, a study by Zhang and Xie (2021) found that students who actively engage in digital collaboration and seek peer feedback tend to perform better in group tasks, reinforcing the importance of collaborative skills in online environments.

The results suggest the need for digital literacy programs that focus on strengthening communication and teamwork strategies in virtual spaces.

Encouraging students to engage in structured digital collaboration activities can help enhance their ability to work effectively in online group settings.

Another significant skill to consider in digital literacy is awareness skill, which pertains to understanding the ethical, legal, and security implications in using digital technologies. It helps individuals recognize online risks, protect their personal data, and engage responsibly in digital spaces. Developing these skills ensures safer, more informed interactions in the digital world, and reducing vulnerability to cyber threats and misinformation. Table 8 highlights the importance of digital literacy in terms of awareness skills.

Table 8. The Extent of Digital Literacy of Senior High School Students in terms of Awareness Skill

DESCRIPTION	MEAN	SD	DESCRIPTIVE EQUIVALENT
Can identify credible sources of information online.	3.47	0.82	High
Aware of the risks associated with sharing personal information online.	3.61	1.00	High
Understands how to use various digital tools effectively for learning.	3.53	0.89	High
Know how to manage privacy settings on social media platforms	3.76	0.97	High
Aware of how online actions contribute to digital footprint.	3.63	0.96	High
Awareness Skill	3.60	0.93	High

Table 8 presents the respondents' awareness skills in various aspects of digital literacy. The results indicate that respondents generally exhibit a high level of awareness, as evidenced by the overall mean score of 3.60 with a standard deviation of 0.93, which corresponds to a *High* descriptive equivalent.

This highlights that senior high school students of Tibanban National High School are proficient in using digital tools in terms of awareness skills.

Among the specific indicators, the highest mean value of 3.76 and a standard deviation of 0.97 which is classified as *High* was obtained from the statement, which highlights that those students know how to manage privacy settings on social media platforms, suggesting that respondents prioritize online privacy management. This is followed by awareness of how online actions contribute to their digital footprint which yielded a mean value of 3.63 and standard deviation of 0.96 which corresponds as *High* and understanding of the risks associated with sharing personal information online with a mean value of 3.61 and standard deviation of 1.00. These findings indicate that respondents are proficient in using digital tools in terms of awareness skills which emphasizes that they can recognize the importance of responsible online behavior and data security.

However, the lowest mean value of 3.47 and a standard deviation of 0.82 with a description equivalent of *High* was obtained from the statement which asserts that students can identify credible sources of information online, which, despite still being high, suggests that some respondents may struggle with distinguishing reliable information from misinformation. This is an important skill, especially in an era of widespread digital content. The standard deviation values range from 0.82 to 1.00, indicating some variability in responses, particularly in awareness of the risks associated with sharing personal

information. This suggests that while some respondents are highly aware, others may still need more education on online privacy and security.

Overall, the findings emphasize the respondents' strong awareness of online privacy and digital responsibility, though there is room for improvement in evaluating information credibility. This aligns with the study of Fajardo (2023), which highlights the need to enhance digital literacy education, particularly in author-checking, fact-checking, and bias recognition skills.

Table 9. Summary on the Extent of Digital Literacy of Senior High School Students in terms of Operation Skill, Thinking Skill, Collaborative Skill, and Awareness Skill

INDICATORS	MEAN	SD	DESCRIPTIVE EQUIVALENT
Operation Skill	3.40	0.93	High
Thinking Skill	3.45	0.92	High
Collaborative Skill	3.38	0.86	Moderate
Awareness Skill	3.60	0.93	High
The Extent of Digital Literacy of Senior High School Students	3.46	0.91	High

Table 9 presents the summary of the independent variable in this study, which is the extent of digital literacy, composed of four (4) indicators: operation skill, thinking skill, collaborative skill, and awareness skill. Based on the data presented in Table 9, the extent of digital literacy among the 180 senior high school students who participated in the study is summarized according to these indicators.

Among the four (4) indicators, three (3) were given the descriptive equivalent of *High*. Awareness skill had the highest mean value of 3.60, with a standard deviation of 0.93, followed closely by thinking skill with a mean of 3.45 and a standard deviation of 0.92. Operation skill also received a *High* rating, with a mean of 3.40 and a standard deviation of 0.93. These results suggest that students are proficient in using digital tools to access, evaluate and create information in a technology driven environment and perceive themselves as highly competent in these areas of digital literacy.

However, collaborative skill received a descriptive equivalent of *Moderate*, with a mean value of 3.38 and a standard deviation of 0.86. This indicates that students have basic skills in using digital tools but may struggle with complex task like critical evaluation and advanced content creation, which suggests a potential area for improvement.

The overall mean for the extent of digital literacy among senior high school students was 3.46, with a standard deviation of 0.91, which corresponds to a *High* descriptive equivalent. This finding suggests that students are generally proficient in using digital tool as they perceive themselves possessing a strong level of digital literacy. According to Ng (2012), digital literacy encompasses not only technical skills but also the ability to critically engage with digital content and collaborate effectively. The results align with the findings of Buckingham (2015), who emphasized that while students today are generally proficient in

using digital tools, there may still be gaps in higher-order digital skills, such as critical thinking and collaboration.

The Level of Student-Faculty Interactions

The level of student-faculty interactions refers to the frequency, quality, and depth of engagement between students and faculty members. These interactions play a crucial role in academic success, personal development, and overall learning experiences. Strong student-faculty interactions contribute to better understanding of course materials, mentorship opportunities, and a supportive educational environment. Conversely, limited interactions may hinder students' ability to seek guidance, clarify concepts, and build professional relationships.

The level of student-faculty interaction plays a crucial role in building trust, which is essential for a supportive and effective learning environment. When students feel that faculty members are approachable, responsive, and invested in their success, they are more likely to seek guidance, share concerns, and engage in their education. Strong trust between students and faculty fosters open communication, academic confidence, and a positive learning experience. Table 10 presents the level of student-faculty interaction in terms of trust.

Table 10 shows the respondents' level of trust in their teachers' use of digital platforms. The overall mean is 3.34, with a standard deviation of 0.95, corresponding to a descriptive equivalent of *Moderate*. This highlights that

students regularly engage with their teacher as they are comfortable approaching their teacher with their concerns and guidance in online learning.

The highest mean value of 3.57 and a standard deviation of 0.92, which corresponds as *High* is observed for the perception that feedback received from teachers through digital platforms are constructive and helpful. This finding aligns with the study of Carless and Boud (2018), which emphasizes the crucial role of feedback in improving student learning outcomes and fostering trust between educators and students.

Table 10. The Level of Student- Faculty Interaction in terms of Trust

DESCRIPTION	MEAN	SD	DESCRIPTIVE EQUIVALENT
Teachers are readily available to assist students through digital platforms.	3.28	0.95	Moderate
Students feel comfortable approaching their teachers for help with digital literacy issues.	3.14	0.96	Moderate
Teachers provide adequate support when students encounter challenges in online learning.	3.22	0.93	Moderate
There is a high level of trust in teachers' competence in using digital tools for teaching and communication.	3.48	0.93	High
Feedback received from teachers through digital platforms is perceived as constructive and helpful.	3.57	0.92	High
Trust	3.34	0.95	Moderate

Trust in teachers' competence in using digital tools scored a mean of 3.48 and a standard deviation of 0.93, described as *High*, indicating that respondents regularly engage with their teachers, and they generally perceive their teachers as digitally competent. This suggests that digital competency among educators significantly enhances trust and engagement in virtual learning environments.

However, aspects such as teachers' availability to assist students through digital platforms resulted a mean of 3.28 and a standard deviation of 0.95; adequacy of support provided by teachers when encountering challenges obtained a mean of 3.22 and a standard deviation of 0.93, and students' comfort in seeking help from teachers about digital literacy issues yielded a mean of 3.14 and a standard deviation of 0.96. All of these statements were rated as *Moderate*, indicating that students occasionally engage with their teacher, suggesting that some areas require improvement.

Overall, the findings reveal a *Moderate* level of trust in teachers' use of digital platforms, particularly in their competence and feedback, indicating that students occasionally engage with their teacher in digital learning. However, there is still a room for improvement in accessibility and personalized support, as suggested by modern educational frameworks prioritizing accessibility and teacher-student interaction.

Another significant indicator that plays a crucial role in student-faculty interactions is communication, where it ensures that students clearly understand expectations, feedback, and academic support. Open

communication fosters a more engaging learning environment where students feel comfortable asking questions and expressing their ideas. Strong communication between students and faculty enhances learning outcomes, collaboration, and overall academic success. Table 11 presents the level of student-faculty interactions in terms of communication.

Table 11. The Level of Student- Faculty Interaction in terms of Communication

DESCRIPTION	MEAN	SD	DESCRIPTIVE EQUIVALENT
Students feel comfortable communicating with their teachers through digital platforms (e.g., email, chat).	3.22	0.98	Moderate
There may be challenges for students in expressing their ideas clearly through digital communication compared to in-person interactions with teachers.	3.25	0.87	Moderate
Teachers respond promptly to student messages on digital platforms.	3.34	0.86	Moderate
Students feel supported by their teachers during digital communications	3.31	0.94	Moderate
Teachers provide clear instructions during digital communications.	3.47	0.86	High
Communication	3.32	0.91	Moderate

The highest mean value of 3.47 and a standard deviation of 0.86 corresponds to the statement that teachers provide clear instructions during digital communication, with a descriptive equivalent of *Moderate*. This emphasize that clarity in communication significantly impacts student

understanding and performance in online learning as they gain some support and feedback through occasionally engage with their teachers.

Teachers respond promptly to student messages on digital platforms resulted a mean of 3.34 and a standard deviation of 0.86, which corresponds to *Moderate* descriptive equivalent. Moreover, students often feel supported by their teachers during digital communications resulted a mean of 3.31 with a standard deviation of 0.94 also received *Moderate* ratings. These findings are similar to the study of Lepp and colleagues (2019), who found that timely and empathetic responses from educators strengthen student engagement and motivation in virtual learning environments.

However, students expressed challenges in clearly communicating their ideas through digital platforms obtained a mean of 3.25 and a standard deviation of 0.87, and their comfort in engaging digitally with teachers scored the lowest with a mean of 3.22 and a standard deviation of 0.98, both described as *Moderate*. This emphasizes that students occasionally interact with their teachers, which suggest that they often lack deeper engagement. This aligns with the study of Lowenthal and colleagues (2020), which underscores the importance of fostering a strong sense of social presence to address communication barriers in online education.

The findings suggest that while digital communication between teachers and students is moderately effective, there is a need for strategies to enhance student comfort and expression. Modern approaches, such as implementing

collaborative digital tools and training teachers in fostering social presence, could significantly improve these outcomes, as supported by Sung and Hwang (2018).

Another significant indicator to measure the level of student-faculty interaction is level of engagement, where it directly influences student engagement by fostering a supportive and interactive learning environment. When faculty actively communicate and collaborate with students, it encourages participation, motivation, and deeper involvement in academic activities. Strong engagement enhances learning experiences, promotes critical thinking, and helps students feel more connected to their educational journey.

In Table 12, it was found that respondents generally agree that they are engaged in learning when interacting with teachers online, as this statement corresponds to the highest mean value of 3.33 and a standard deviation of 0.88, with a descriptive equivalent of *Moderate*. This emphasizes that students occasionally interact with their teachers in this technology driven world, suggesting that while students find digital interactions with teachers engaging, there may still be limitations to fully replicating the engagement level of face-to-face interactions. This finding aligns with studies by Richardson and colleagues (2017), which highlight that online learning engagement depends on interactivity and instructional design. Moreover, this indicates that while online learning platforms have made progress in fostering engagement, additional improvements

in both technology and teaching strategies may be needed to enhance the overall experience.

Table 12. The Level of Student-Faculty Interaction in terms of Level of Engagement

DESCRIPTION	MEAN	SD	DESCRIPTIVE EQUIVALENT
Actively participating in discussions with teachers through digital platforms.	3.23	0.87	Moderate
Engaged in digital course materials provided by teachers.	3.28	0.85	Moderate
Engaged in learning when interacting with teachers online.	3.33	0.88	Moderate
Enjoy doing digital projects or assignments given by teacher.	3.23	0.98	Moderate
Feel more engaged in the learning process because of the opportunity to communicate with teacher digitally.	3.32	0.88	Moderate
Level of Engagement	3.28	0.89	Moderate

On the other hand, the statement that students feel more engaged in the learning process because of the opportunity to communicate with teachers digitally has a mean value of 3.32 and a standard deviation of 0.88. This also indicates a descriptive equivalent of *Moderate*, suggesting that digital communication with teachers enhances engagement, but students may still prefer traditional methods of interaction. This result is supported by research from Martin and Bolliger (2018), which found that digital engagement strategies such as feedback and interactive discussions positively impact student motivation.

Furthermore, engagement in digital course materials provided by teachers

has a mean value of 3.28 and a standard deviation of 0.85 with a descriptive equivalent of *Moderate*. This indicates that students find digital resources useful through their occasional interaction with their teachers but may still require additional support for optimal engagement. This finding is consistent with the work of Bonk and Khoo (2014), who found that effective digital course materials improve student engagement when designed to be interactive and user-friendly.

Additionally, students' active participation in discussions with teachers through digital platforms has a mean value of 3.23 and a standard deviation of 0.87, corresponding to a descriptive equivalent of *Moderate*. This suggests that while students participate in digital discussions, their engagement may not be as strong as in traditional classroom discussions. According to Garrison and Arbaugh (2007), online discussions can be effective if structured properly, but they require active facilitation to maintain engagement.

Moreover, enjoying digital projects or assignments given by teachers has the lowest mean value of 3.23 with a standard deviation of 0.98, still indicating a descriptive equivalent of *Moderate*. This suggests that while students appreciate digital assignments, they may not find them as engaging as traditional hands-on projects. This result aligns with studies by Chen and colleagues (2010), which found that engagement in digital projects depends on factors such as project design, collaboration opportunities, and technical ease of use.

The overall mean for the level of engagement is 3.28 with a standard deviation of 0.89, corresponding to a descriptive equivalent of *Moderate*. This

highlights that students occasionally interact with their teachers, which suggests that while digital learning tools and interactions with teachers contribute to student engagement, they do not fully replace the engagement levels experienced in face-to-face settings. The results align with the work of Kahu (2013), who emphasizes that engagement in digital learning requires a combination of social, cognitive, and emotional factors to be effective.

Table 13 presents the level of student-faculty interactions in terms of collaborative outcomes. When students and faculty actively engage, they can work together on research, projects, and problem-solving, leading to deeper learning and innovation. This collaboration enhances academic success, prepares students for professional teamwork, and strengthens the overall educational experience.

Table 13. The Level of Student- Faculty Interaction in terms of Collaborative Outcomes

DESCRIPTION	MEAN	SD	DESCRIPTIVE EQUIVALENT
Digital collaboration with teachers enhances learning.	3.26	0.88	Moderate
Digital teacher-student collaboration improves learning.	3.36	0.85	Moderate
Students can effectively collaborate with teachers digitally to solve problems.	3.29	0.82	Moderate
Face-to-face communication with teachers may be more beneficial than digital collaboration.	3.83	1.03	High
Digital collaboration with teachers is expected to enhance future academic success.	3.46	1.01	High
Collaborative Outcomes	3.44	0.94	High

In Table 13, it was found that respondents generally agree that face-to-face communication with teachers may be more beneficial than digital collaboration. This statement yielded the highest mean value of 3.83 and a standard deviation of 1.03 with a descriptive equivalent of *High*. This suggests that students still prefer direct, in-person interactions with teachers when it comes to learning and problem-solving. This finding aligns with studies by Sun and Rueda (2012), which emphasize that face-to-face interactions improve student engagement and understanding in learning environments.

On the other hand, the statement that digital collaboration with teachers is expected to enhance future academic success has a mean value of 3.46 and a standard deviation of 1.01. This also indicates a descriptive equivalent of *High*, suggesting that students recognize the long-term benefits of digital collaboration despite potential challenges. This result is supported by research from Hrastinski (2008), which highlights that online collaboration fosters deeper learning experiences by providing flexibility and accessibility to students.

Furthermore, digital teacher-student collaboration improving learning has a mean value of 3.36 and a standard deviation of 0.85 with a descriptive equivalent of *Moderate*. This means that while students acknowledge the advantages of digital collaboration, they may still encounter barriers such as communication gaps or technological issues. This finding emphasizes that while online learning can be effective, student engagement varies based on digital literacy and interaction quality.

Additionally, students' ability to effectively collaborate with teachers digitally to solve problems has a mean value of 3.29 and a standard deviation of 0.82, corresponding to a descriptive equivalent of *Moderate*. This suggests that students recognize digital collaboration as a useful tool for problem-solving but may find it less effective than traditional methods. According to Means and colleagues (2013), digital collaboration is most effective when combined with well-structured instructional strategies.

Moreover, digital collaboration with teachers enhancing learning has the lowest mean value of 3.26 with a standard deviation of 0.88, still indicating a descriptive equivalent of *Moderate*. This suggests that while students acknowledge the role of digital tools in education, they may not view them as a complete substitute for traditional learning methods. This result aligns with studies by Alqurashi (2019), which found that perceived learning effectiveness in digital environments depends on factors such as interactivity, student motivation, and instructional design.

The overall mean for collaborative outcomes is 3.44 with a standard deviation of 0.94, corresponding to a descriptive equivalent of *High*. This highlights that student occasionally interact with their teachers in terms of collaborative outcomes, suggesting that while digital collaboration is valued, students still place a higher premium on direct communication and structured interactions with teachers. The results align with the work of Garrison and

Vaughan (2008), who advocate for blended learning approaches that integrate both face-to-face and digital collaboration to optimize learning outcomes.

Table 14. The Summary on the Level of Student- Faculty Interaction in terms of Trust, Communication, Level of Engagement, and Collaborative Outcomes

INDICATORS	MEAN	SD	DESCRIPTIVE EQUIVALENT
Trust	3.34	0.95	Moderate
Communication	3.32	0.91	Moderate
Level of Engagement	3.28	0.89	Moderate
Collaborative Outcomes	3.44	0.94	High
Level of Student- Faculty Interaction	3.34	0.92	Moderate

The dependent variable, student-faculty interaction, is measured using four (4) indicators: trust, communication, level of engagement, and collaborative outcomes. Table 14 presents a summary of how these indicators reflect the extent of student-faculty interaction among the senior high school students who participated in the study. The table highlights the varying degrees of interaction based on each indicator. This provides insights into how students perceive their relationship with faculty and how these perceptions may influence their academic experience. The findings help to better understand the factors contributing to effective student-faculty interactions in a senior high school setting.

Among the four (4) indicators assessed, only collaborative outcomes received a descriptive equivalent of *High*. This indicator had the highest mean value of 3.44, with a standard deviation of 0.94, suggesting that students frequently engage in meaningful interactions with faculty members. Such interactions likely foster effective collaboration in areas such as teamwork, shared decision-making, and academic projects, contributing to a more supportive and interactive learning environment.

On the other hand, trust, communication, and level of engagement all received a descriptive equivalent of *Moderate*, with mean values of 3.34, 3.32, 3.28 and 3.44 respectively, and standard deviations of 0.95, 0.91, 0.89 and 0.94. These results indicate that student-faculty interaction is occasional, while students recognize a reasonable level of interaction with faculty in these aspects, there is room for improvement in building stronger trust, enhancing communication, and increasing student engagement.

The overall mean for the level of student-faculty interaction was 3.34, with a standard deviation of 0.92, which corresponds to a *Moderate* descriptive equivalent. This finding emphasizes that students occasionally interact with their teachers, which suggests that students have a neutral to moderate positive perception of their interactions with faculty. Research by Kuh and colleagues (2005) highlights the importance of strong student-faculty relationships in promoting student success and academic development. Similarly, Tinto (2012)

emphasizes that meaningful interactions with faculty can enhance student motivation, learning engagement, and retention in academic institutions.

The Relationship Between Digital Literacy and Student-Faculty Interactions

The relationship between digital literacy and student-faculty interactions is crucial, as it significantly influences communication, engagement, and academic success in digital learning environments. Higher levels of digital literacy enable students and faculty to navigate online platforms effectively, facilitating seamless interactions, timely feedback, and collaborative learning experiences. Lower digital literacy levels, on the other hand, can create barriers to engagement, leading to miscommunication and reduced academic participation. Institutions that prioritize digital literacy development can foster stronger student-faculty relationships, ensuring more effective and inclusive learning experiences.

Table 15 presents a significant statistical correlation between digital literacy and student-faculty interactions, revealing a correlation coefficient of 0.579 with a sample size of $N = 166$. Following the classification of Bluman (2009), this coefficient denotes a moderate positive relationship, indicating a significant association between digital literacy and student-faculty interactions.

The results also revealed a significant relationship between these variables, as evidenced by a p-value of 0.000, which is below the conventional

Table 15. The Relationship Between Digital Literacy and Student-Faculty Interactions

Observed Factor	Spearman's Rho Statistics	Digital Literacy	Remarks
Student-Faculty Interactions	Correlation Coefficient	0.579	Moderate Positive and Significant Relationship
	P-value	0.000	
	N	166	

significance level of 0.05. This implies that digital literacy has a moderate positive and significant relationship with student-faculty interactions. Hence, it can be concluded that students with higher digital literacy levels are more likely to engage in meaningful interactions with faculty members, utilizing digital tools and platforms for communication, collaboration, and academic discourse. Consequently, the null hypothesis is rejected, confirming the presence of a substantial association between digital literacy and student-faculty interactions.

This finding is supported by various researchers who argue that digital literacy plays a crucial role in fostering academic engagement. According to Ng (2012), digital literacy enhances students' ability to navigate online learning environments, improving their ability to communicate effectively with faculty members. Similarly, Redecker (2017) emphasizes that students with higher digital competencies tend to engage more in academic discussions, seek guidance from faculty, and utilize digital platforms for knowledge-sharing.

However, these findings contrast with the research conducted by Selwyn (2016), which suggests that digital literacy alone is not a strong predictor of

student-faculty interactions. Selwyn argues that other factors, such as institutional support, faculty engagement, and students' motivation, also play a significant role in shaping interactions between students and educators. Furthermore, some studies highlight that excessive reliance on digital communication may reduce face-to-face interactions, potentially impacting the depth of student-faculty relationships (Garrison & Vaughan, 2008).

Viewed through the lens of Constructivist Learning Theory (CLT), these findings highlight that knowledge is actively constructed through social interactions, making digital literacy a pivotal catalyst for meaningful student-faculty engagement. Moreover, the Engagement and Technology Integration Theory underscores how the effective use of digital tools fosters deeper academic involvement and helps students develop critical digital skills for communication and collaboration. This synergy is further enriched by the concept of Participatory Culture, which positions students not just as consumers of information but also as co-creators who share and shape knowledge in online environments. As learners refine their digital competencies, they become more adept at seeking academic support, collaborating on research, and contributing to virtual discussions—ultimately reinforcing the transformative role of digital literacy in higher education. Understanding these dynamics provides valuable insights into the evolving nature of student-faculty relationships in the digital era.

CHAPTER V

SUMMARY, CONCLUSIONS, AND RECOMMENDATIONS

This chapter presents the summary of the findings. It also provides assertions and recommendations on the impact of consumers' perceived risks and online purchase intention.

Summary

This study identified two variables: digital literacy as the independent variable and student-faculty interaction as the dependent variable.

Three objectives were established to determine the relationship and impact of these variables. The study assessed the extent of digital literacy among senior high school students and examined how it influenced their level of interaction with faculty members.

Based on the study's findings, the extent of students' digital literacy, categorized by operational skills, thinking skills, collaboration skills, and awareness skills, was generally high. Among these, operational, thinking and awareness skills were more prominent, while collaboration skills showed moderate levels. This suggests that while students are proficient in using digital tools, critically assess digital information and navigate ethical considerations, their ability to engaging in online collaboration needs further improvement.

The extent of student-faculty interaction, measured in terms of trust, communication, engagement, and collaborative outcomes, was categorized as

moderate. The findings indicate that students who demonstrated higher digital literacy skills were more likely to collaborate on learning activities. However, challenges such as limited access to digital resources, varying faculty digital competencies and lack of engagement in meaningful academic discussions impacted the overall student-faculty interaction.

Findings further revealed that digital literacy and student-faculty interaction were positively and significantly correlated. The tested hypothesis was based on Spearman's rho correlation, where the p-value was less than 0.05, confirming that higher digital literacy contributes to increased student-faculty engagement. Additionally, the effect size indicated a strong, positive, and significant relationship between the identified variables.

Finally, the hypothesis stating that there is no significant relationship between digital literacy and student-faculty interaction was rejected, as statistical analysis confirmed a meaningful connection between these variables.

Conclusion

Based on the findings and analysis presented in this study, the following conclusions were drawn:

The extent of digital literacy among senior high school students is categorically described as high.

The extent of student-faculty interaction among senior high school students is categorically described as moderate.

There was a positive and significant relationship between digital literacy and student-faculty interaction.

Based on the results generated from the study, it is clear that the hypothesis should be rejected since digital literacy and student-faculty interaction had a positive and significant relationship.

Recommendations

Based on the findings and conclusions of the study, the following recommendations were forwarded to the researchers:

To the **Faculty Members**, it is recommended to integrate digital tools and online platforms into their teaching strategies to enhance student-faculty interaction. This recommendation stems from the study's findings that while students demonstrate high digital literacy, their engagement with faculty remains moderate, highlighting the need for more structured digital communication. Faculty members should promote digital communication by utilizing emails, discussion forums, and learning management systems to provide students with accessible academic support. Additionally, they should offer training and guidance on research databases, citation tools, and collaboration platforms to help students develop stronger digital competencies. By integrating these recommendations, faculty members can strengthen student-faculty interaction, enhance digital engagement, and equip students with essential skills for academic and professional success.

To **Educational Institutions**, it is recommended that they should prioritize the integration of digital literacy into their curriculum to enhance student learning outcomes. By leveraging technology-driven teaching methods, institutions can equip students with essential digital skills that are crucial for academic success and future professional challenges. To implement this effectively, institutions should develop policies that promote the use of interactive digital learning tools, such as online collaboration platforms, virtual simulations, and multimedia resources. Additionally, faculty training programs should be established to ensure educators are well-equipped to integrate technology into their teaching methodologies. By fostering an environment that encourages digital literacy, institutions can enhance student engagement, improve communication between faculty and students, and prepare graduates for an increasingly digital world.

To the **Policy Makers**, it is recommended to develop and implement policies that promote digital literacy and enhance student-faculty interaction in secondary education. This recommendation stems from the study's findings that while students demonstrate high levels of digital literacy, their engagement with faculty members remains moderate. To address this, policy makers should integrate digital literacy programs into the national curriculum and provide training for both students and educators to strengthen their digital competencies. Additionally, investing in digital infrastructure, such as reliable internet access and secure online learning platforms, can improve the accessibility and efficiency of student-faculty communication. By initiating these

recommendations, policy makers can foster a technology-driven educational system that enhances learning, engagement, and digital responsibility.

To the **Curriculum Developers**, it is recommended to integrate digital literacy into the curriculum through structured online platforms, clear communication, and technology-driven activities. This recommendation stems from the study's findings that students benefit from digital tools but face challenges such as technological barriers that affect engagement. To address this, curriculum developers should incorporate interactive digital learning materials, such as PowerPoint, Google Slides, and online research projects, to enhance student participation. To further ensure that digital literacy activities are designed to promote critical thinking, collaboration, and problem-solving will help students develop essential skills for academic and professional success. By implementing these measures, curriculum developers can foster an engaging, technology-driven learning environment that improves digital proficiency and student-faculty interaction.

To **Future Researchers**, it is recommended to examine additional factors that may affect digital literacy and student-faculty interaction. This recommendation stems from the study's findings that while students exhibit a high level of digital literacy, their collaboration skills are moderate, and student-faculty interaction remains at a moderate level. Exploring variables such as socio-economic status, access to digital resources, and institutional support may

provide deeper insights and contribute to more effective strategies for enhancing digital education and engagement.

 TIBANBAN NATIONAL HIGH SCHOOL
 Tibanban, Governor Generoso, Davao Oriental

January 23, 2025

MARCIAL L. ARLES, JR.
 PSDS/ Concurrent School In-charge
 Tibanban National High School

Sir:

Greetings!

The undersigned is currently working on a study entitled: **Digital Literacy and Student-Faculty Interaction: A Quantitative Study Among Senior High School Students.**

In line with this, the undersigned would like to ask permission from your good office to allow us to conduct a study in your school where all the senior high school students are the identified respondents.

May this merit your kind and favorable response. Thank you and more power.

Respectfully yours,

STEPHANIE ROSE C. AGUANTA
 Researcher

APPENDIX C

Adapted and Modified Survey Questionnaire

SURVEY QUESTIONNAIRE ON DIGITAL LITERACY AND STUDENT-FACULTY INTERACTION AMONG SENIOR HIGH SCHOOL STUDENTS

Adapted and modified from Yazon, Ang-Manaig, Buama, Tesoro (2019) and Budiman & Syafrony (2023)

Dear Respondent,

The researcher requests your participation in this study entitled **"Digital Literacy and Student-Faculty Interaction: A Quantitative Study Among Senior High School Students"**. This study seeks to determine the relationship and influence of digital literacy to student-faculty interaction among senior high school students. Taking part in this survey is entirely voluntary. There are no correct or incorrect answers to the given questions. If you have questions and clarifications about this questionnaire and the study, you are encouraged to discuss it with the researcher. Rest assured that your answers will be treated with utmost confidentiality and respect. Your cooperation and participation in this study will be a valuable contribution and will be highly appreciated.

Part I. Personal Information

Name: _____
(optional)

Grade Level & Section:

☐	Grade 11- Laurel	☐	Grade 12- Macapagal
☐	Grade 11- Quezon	☐	Grade 12- Duterte
☐	Grade 11- Roxas	☐	Grade 12- Marcos
☐	Grade 11- Quirino	☐	Grade 12- Garcia

Part II.

Direction: Read and understand the following statements. Place a check mark (/) on the corresponding number that best describes your digital literacy in student-faculty interaction. Refer to the scale below:

Likert Scale

Scale	Verbal Description
5	Strongly Agree
4	Agree
3	Not sure
2	Disagree
1	Strongly Disagree

STATEMENTS	5	4	3	2	1
I. DIGITAL LITERACY					
A. OPERATIONAL SKILLS					
1. I know how to use a wide range of strategies when searching for information.					
2. I know some good ways to avoid computer viruses.					
3. I have no problems finding my way around a website.					
4. I know how to use shortcut keys.					
5. I know how to change who I share content with (e.g. friends, friends of friends or public).					
B. THINKING SKILLS					
6. I evaluate the credibility of online sources before using them.					

STATEMENTS	5	4	3	2	1
7. I feel confident in my ability to find solutions online when faced with a technical issue.					
8. I effectively integrate information from multiple digital sources.					
9. I am able to make informed decisions based on digital information.					
10. I seek diverse perspectives online before making a decision.					
C. COLLABORATION SKILLS					
11. I frequently collaborate with peers using digital tools.					
12. I feel confident using digital tools (e.g., Google Docs, Zoom) for collaboration.					
13. I effectively communicate my ideas during digital collaborative projects.					
14. I actively seek and value feedback from my peers in digital collaborations.					
15. I am comfortable resolving conflicts that arise during digital collaboration.					
D. AWARENESS SKILLS					
16. I can identify credible sources of information online.					
17. I am aware of the risks associated with sharing personal information online.					
18. I understand how to use various digital tools effectively for learning.					
19. I know how to manage my privacy settings on social media platforms.					
20. I am aware of how my online actions contribute to my digital footprint.					
II. STUDENT-FACULTY INTERACTION					
A. TRUST					
21. My teachers are readily available to assist me through digital platforms.					
22. I feel comfortable approaching my teacher for help with digital literacy issue.					
23. My teachers provide adequate support when I encounter challenges in online learning.					
24. I trust that my teachers are competent in using digital tools for teaching and communication.					
25. I trust that the feedback I receive from my teachers through digital platforms is constructive and helpful.					
B. COMMUNICATION					
26. I feel comfortable communicating with my teachers through digital platforms (e.g., email, chat).					
27. I struggle to express my ideas as clearly through digital communication as I would in person with my teacher.					

STATEMENTS	5	4	3	2	1
28. My teachers respond promptly to my messages on digital platforms.					
29. I feel supported by my teachers when I communicate with them digitally.					
30. My teachers provide clear instructions during digital communications.					
C. LEVEL OF ENGAGEMENT					
31. I actively participate in discussions with my teachers through digital platforms.					
32. I engage with digital course materials provided by my teachers.					
33. I feel engaged in my learning when interacting with my teachers online.					
34. I enjoy doing digital projects or assignments given by my teacher.					
35. I feel more engaged in the learning process because of the opportunity to communicate with my teacher digitally.					
D. COLLABORATIVE OUTCOMES					
36. I feel that collaborating with my teacher through digital platforms enhances my learning experience.					
37. My collaborative experiences with my teacher through digital platforms positively impact my overall learning outcomes.					
38. I can collaborate effectively with my teacher through digital platforms to solve problems.					
39. I believe that face-to-face communication with my teacher would be more beneficial than digital collaboration.					
40. I believe that digital collaboration with my teacher will continue to enhance my academic success in the future.

Validation Sheet for Research Questionnaire

Republic of the Philippines
Department of Education
 REGION XI
 SCHOOLS DIVISION OF DAVAO ORIENTAL
 TIBANBAN NATIONAL HIGH SCHOOL
 Tibanban, Governor Generoso, Davao Oriental

VALIDATION SHEET FOR RESEARCH QUESTIONNAIRE

Name of Evaluator: **HONEY MARIZ M. MONTESCLAROS**

Position: Teacher II

To the evaluator: Below are the indicators with the corresponding statement for validating the instrument. Please check the appropriate box for your ratings. Use the following guide in rating.

Point Equivalent: 5 – Excellent 3 – Good 1 – Poor
 4 – Very Good 2 – Fair

INDICATORS	5	4	3	2	1
<u>1. Clarity of Directions and Items</u> The vocabulary level, language structure and conceptual level of the questions suit the level of the respondents.	/				
<u>2. Presentation / Organization of Items</u> The items are presented and organized in logical manner	/				
<u>3. Suitability of Items</u> The items appropriately represent the substance of the competency/ies. The questions are designed to determine the knowledge, competency and skills that are supposed to be measured.	/				
<u>4. Adequateness of Items</u> The items represent the coverage of the research adequately. The number of questions is represented enough of the competency defined for the particular research.	/				
<u>5. Attainment of Purpose</u> The instrument as a whole fulfills the objective for which it was constructed.		/			
<u>6. Objectivity</u> Each item /question requires a specific answer or measures the specified competency and no aspect of the questionnaire suggests bias.	/				
<u>7. Scale, Questionnaire and Evaluation Rating System</u> The scale adapted is appropriate for the items	/
